LAB MANUAL

1907506-MICROPROCESSORS & MICROCONTROLLERS LAB

V SEMESTER

(Academic Year – 2022-23 ODD)

Prepared By

Mr.K.R.Ganesh A.P. (Sr.G) / EIE

1907506 MICROPROCESSORS & MICROCONTROLLERS LAB LTPC 0 0 4 2

SYLLABUS

COURSE OBJECTIVES:

- To provide training on programming of microprocessors
- To provide training on programming of microcontrollers
- To provide training on interfacing peripherals with microprocessors.
- To provide training on interfacing peripherals with microcontrollers
- To provide training on interfacing I/O devices with arduino / raspberry pi development boards

LIST OF EXPERIMENTS

8-bit Microprocessor

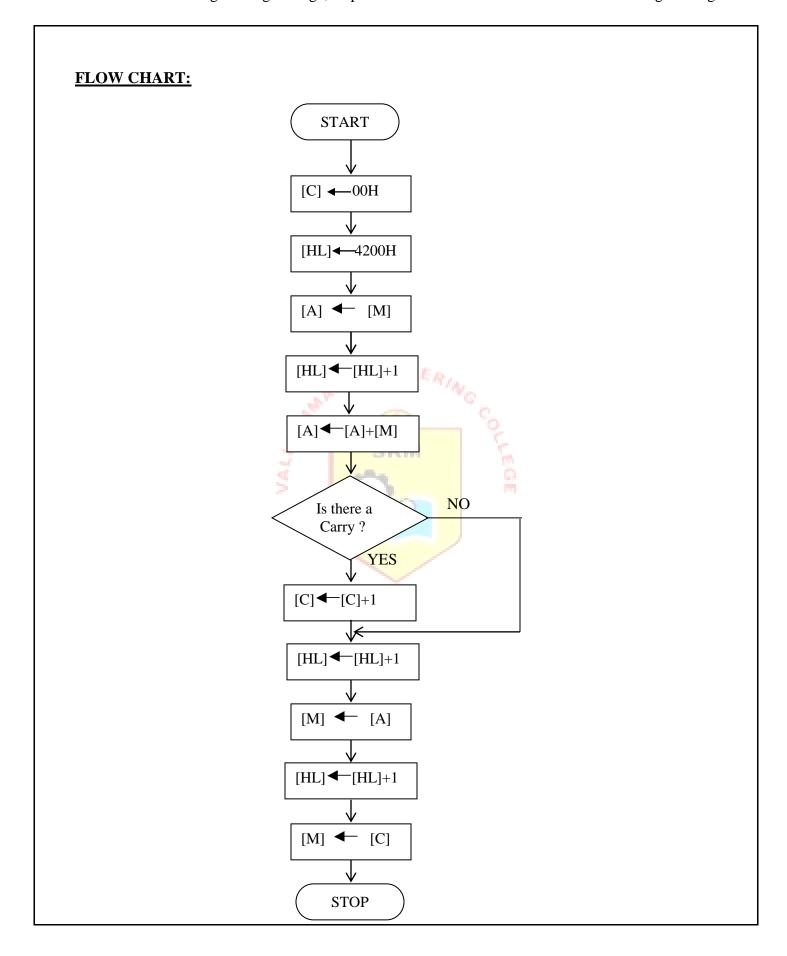

- 1. Simple arithmetic operations: addition / subtraction / multiplication / division.
- Programming with control instructions: a. Ascending / Descending order, Maximum / Minimum of numbers. b. Programs using Rotate instructions. c. Hex / ASCII / BCD code conversions.
- 3. Interface Experiments: with 8085 a. A/D Interfacing & D/A Interfacing.
- 4. Traffic light controller.
- 5. I/O Port / Serial communication
- 6. Read a key, interface display

8-bit Microcontroller

- 7. Demonstration of basic instructions with 8051 Micro controller execution, including: (i) Conditional jumps & looping (ii) Calling subroutines.
- 8. Programming I/O Port and timer of 8051 (i) study on interface with A/D & D/A (ii) Study on Interface with DC & AC motors
- 9. Application hardware development using embedded processors.
- 10. Interfacing of LEDs and sensor with arduino / raspberry pi modules.

CONTENTS

S. NO.	EXPERIMENT NAME	PAGE NO.							
	8085 Experiments								
1A	8 bit data addition	4							
1B	8 bit data subtraction	8							
1C	8 bit data multiplication	12							
1D	8 bit data divison	16							
2A	Largest element in an array	20							
2B	Smallest element in an array	24							
3A	Sorting an array of data in Ascending order	28							
3B	Sorting an array of data in Descending order	34							
4A	Decimal to Hexadecimal conversion	40							
4B	Hexadecimal to decimal conversion	44							
4C	Hexa decimal TO ASCII conversion	48							
4D	ASCII to Hexa decimal conversion	52							
5	Traffic light controller - Interfacing 8255 with 8085	56							
6	Interfacing 8253 Timer with 8085	62							
7	Interfacing 8279 Keyboard / Display with 8085 microprocessor	68							
8	Interfacing 8251 USART with 8085 microprocessor	72							
9	Interfacing Analog to Digital converter 8085 microprocessor	78							
10	Interfacing Digital to Analog converter 8085 microprocessor	82							
	8051 Experiments								
11A	8 bit data addition	88							
11B	8 bit data subtraction	92							
11C	8 bit data multiplication	96							
11D	8 bit data divison	100							
12A	Largest element in an array	104							
12B	Smallest element in an array	108							
13	Interfacing A/D and D/A converter with 8051 microcontroller	112							
14	Interfacing stepper motor with 8051 microcontroller	116							
15	Interfacing of LEDs and sensor with arduino /raspberry pi modules	123							
16	Presentation of hardware development using embedded processor.								
ADVANCED ADDITIONAL EXPERIMENTS									
17	Programs to verify Timer and Interrupts Operations In 8051 microcontroller	133							
18	2 X 2 Matrix Multiplication	137							

1(A) 8-BIT DATA ADDITION

AIM:

To add two 8 bit numbers stored at consecutive memory locations and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Initialize memory pointer to data location.
- 2. Get the first number from memory in accumulator.
- 3. Get the second number and add it to the accumulator.
- 4. Store the answer at another memory location.

ADDRESS	OPCODE	LABEL	MNEMONICS	OPERAND	COMMENT
4100		START	MVI	C, 00	Clear C reg.
4101					
4102			LXI	H, 4200	Initialize HL reg. to
4103					4500
4104					
4105			MOV	A, M	Transfer first data to accumulator
4106			INX	Н	Increment HL reg. to point next memory Location.
4107			ADD	M M	Add first number to acc. Content.
4108			JNC	L1	Jump to location if
4109		. 7		7.	result does not yield
410A		4.4	SRM	770	carry.
410B		3	INR	C 🖳	Increment C reg.
410C		L1	INX	Н	Increment HL reg. to point next memory Location.
410D			MOV	M, A	Transfer the result from acc. to memory.
410E			INX	Н	Increment HL reg. to point next memory Location.
410F			MOV	M, C	Move carry to memory
4110			HLT		Stop the program

OBSERVATION:

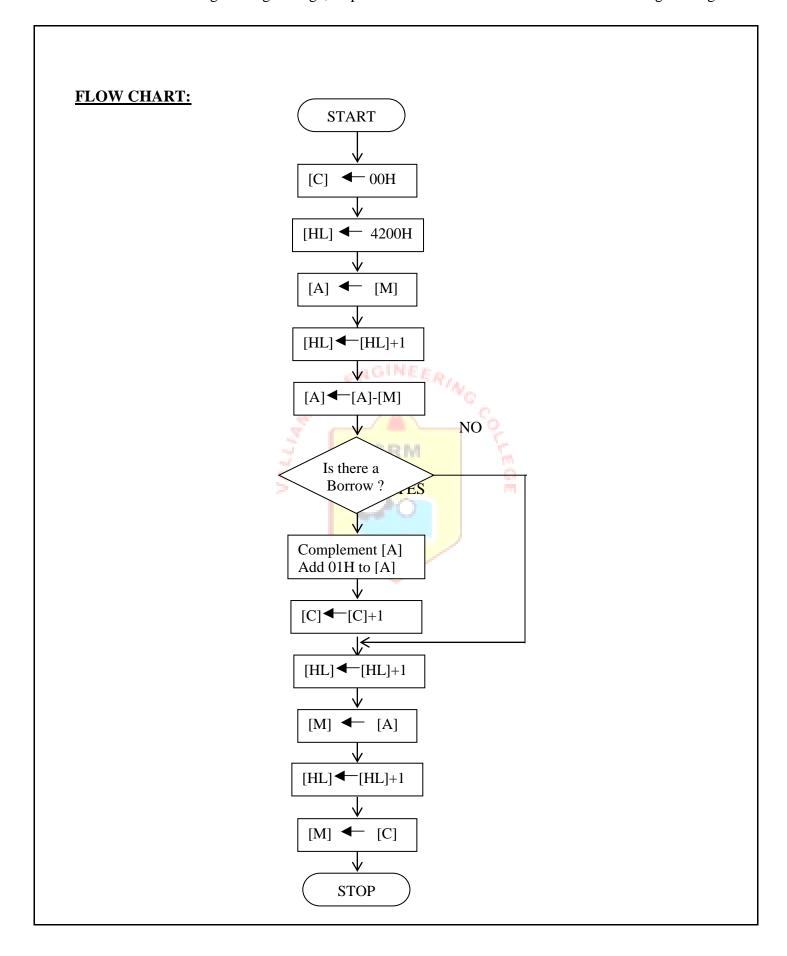

IN	PUT	OUTPUT		
4200		4202		
4201		4203		

RESULT:

Thus the two 8 bit numbers stored at 4200 & 4201 are added and the result is stored at 4202 & 4203.

VIVA QUESTIONS:

- 1. What is the function of LXI H, 4000 H instruction?
- 2. How you can store a data in a memory location?
- 3. What is the meaning of INX
- 3. How you can read a data from a memory location?
- 4. What are flags available in 8085?
- 5. What is the function of RESET key of a 8085 microprocessor kit
- 6. What is the function of JNC instruction?
- 7. What is the difference between conditional and unconditional jump instruction?
- 8. What is multi byte?

1(B) 8-BIT DATA SUBTRACTION

AIM:

To subtract two 8 bit numbers stored at consecutive memory locations and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Initialize memory pointer to data location.
- 2. Get the first number from memory in accumulator.
- 3. Get the second number and subtract from the accumulator.
- 4. If the result yields a borrow, the content of the acc. is complemented and 01H is added to it (2's complement). A register is cleared and the content of that reg. is incremented in case there is a borrow. If there is no borrow the content of the acc. is directly taken as the result.
- 5. Store the answer at next memory location.

ADDRESS	OPCODE	LABEL	MNEMONICS	OPERAND	COMMENT
4100		START	MVI	C, 00	Clear C reg.
4102					
4102			LXI	H, 4200	Initialize HL reg. to
4103					4500
4104					
4105			MOV	A, M	Transfer first data to accumulator
4106			INX	Н	Increment HL reg. to
					point next mem.
					Location.
4107			SUB	M	Subtract first number
					from acc. Content.
4108			JNC	L1	Jump to location if
4109			EMPHINEEL	14.	result does not yield
410A				.6	borrow.
410B		4	INR	C	Increment C reg.
410C		-2	CMA	-	Complement the Acc.
		-nd	ORM	100	Content
410D		40	ADI	01H	Add 01H to content of
410E			1		acc.
410F		L1	INX	Н	Increment HL reg. to
					point next mem.
					Location.
4110			MOV	M, A	Transfer the result from
					acc. to memory.
4111			INX	Н	Increment HL reg. to
					point next mem.
					Location.
4112			MOV	M, C	Move carry to mem.
4113			HLT		Stop the program

OBSERVATION:

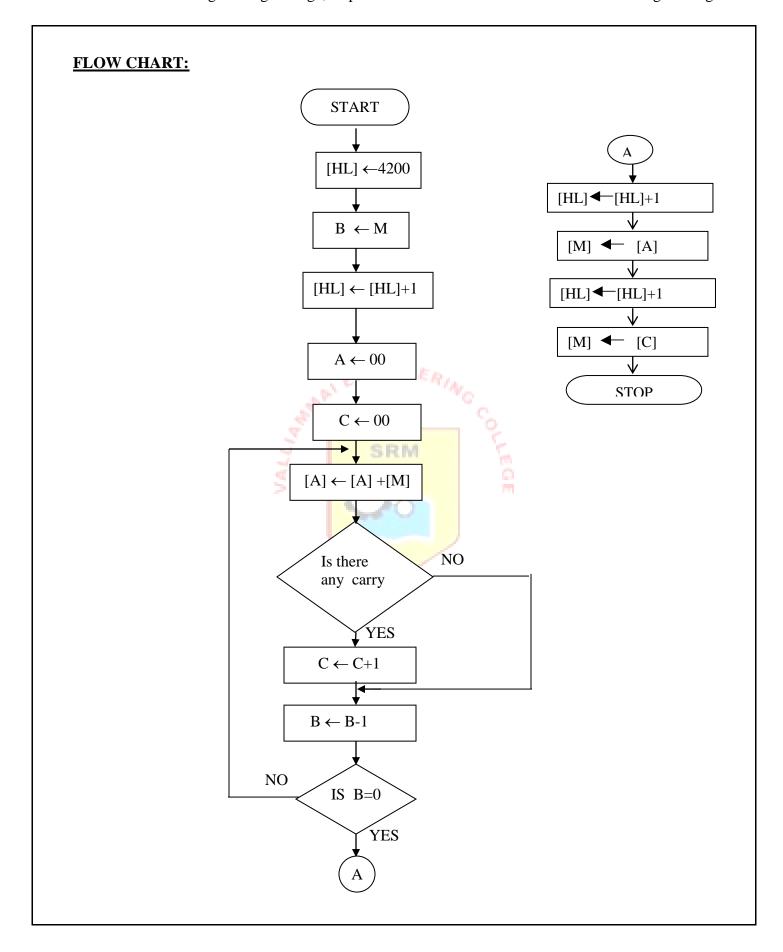

INI	PUT	OUTPUT	
4200		4202	
4201		4203	

RESULT:

Thus the 8 bit numbers stored at 4200 & 4201 are subtracted and the result is stored at 4202 & 4203.

VIVA QUESTIONS:

- 1. What is meant by ADI instruction
- 2. What is an instruction?
- 3. What is Mnemonic?
- 4. What is the purpose of CMA instruction?
- 5. What is the function of stack pointer?
- 6. Why ADI 01H is used in two's complement of an 8-bit number.
- 7. How many memory locations can be addressed by a microprocessor with 14 address lines?

1(C) 8-BIT DATA MULTIPLICATION

AIM:

To multiply two 8 bit numbers stored at consecutive memory locations and also to verify the result .

SRM

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Initialize memory pointer to data location.
- 2. Move multiplicand to a register.
- 3. Move the multiplier to another register.
- 4. Clear the accumulator.
- 5. Add multiplicand to accumulator
- 6. Decrement multiplier
- 7. Repeat step 5 till multiplier comes to zero.
- 8. The result, which is in the accumulator, is stored in a memory location.

ADDRESS	OPCODE	LABEL	MNEMONICS	OPERAND	COMMENT
4100		START	LXI	H, 4200	Initialize HL reg. to
4101					4500
4102					
4103			MOV	B, M	Transfer first data to reg. B
4104			INX	Н	Increment HL reg. to point next mem. Location.
4105			MVI	A, 00H	Clear the acc.
4106					
4107			MVI	C, 00H	Clear C reg for carry
4108			ENGINEER	1.	
4109		L1	ADD	M C	Add multiplicand multiplier times.
410A		3	JNC	NEXT	Jump to NEXT if there
410B		7	SRM	100	is no carry
410C		3			
410D		_	INR	С	Increment C reg
410E		NEXT	DCR	В	Decrement B reg
410F			JNZ	<u> </u>	Jump to L1 if B is not
4110					zero.
4111					
4112			INX	Н	Increment HL reg. to
					point next mem.
					Location.
4113			MOV	M, A	Transfer the result from
					acc. to memory.
4114			INX	Н	Increment HL reg. to
					point next mem.
4115			MOV	MC	Location.
4115			MOV	M, C	Transfer the result from
4116			шт		C reg. to memory.
4110			HLT		Stop the program

OBSERVATION:

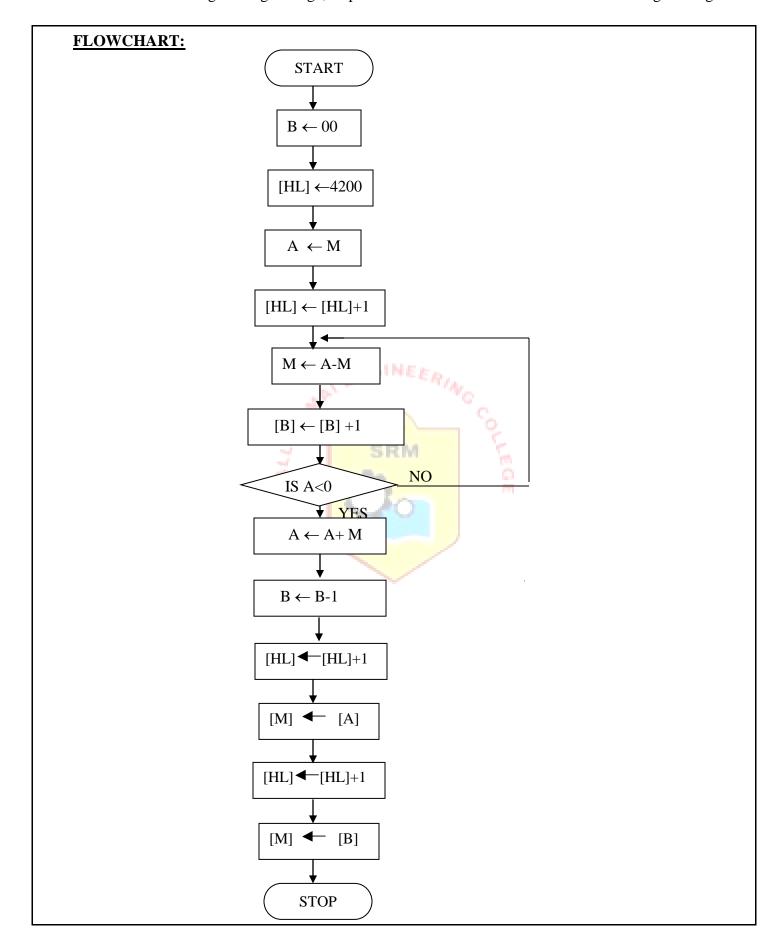

IN	PUT	O	UTPUT
4200		4202	
4201		4203	

RESULT:

Thus the 8-bit multiplication was done in $8085\mu p$ using repeated addition method and also the result is verified.

VIVA QUESTION:

- 1. Define two's complement of an 8-bit numbers.
- 2. What is meant by instruction ADC M?
- 3. What is the use of the instruction MOV A,M
- 4. What is the function of program counter?
- 5. Mention the types of 8085 instruction set.
- 6. How will you perform multiplication using ADD instruction?
- 7. Describe about DAD B instruction.
- 8. What is the purpose of the instruction MOV M,A

1(D) 8-BIT DIVISION

AIM:

To divide two 8-bit numbers stored in memory and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Load Divisor and Dividend.
- 2. Subtract divisor from dividend.
- 3. Count the number of times of subtraction which equals the quotient.
- 4. Stop subtraction when the dividend is less than the divisor .The dividend now becomes the remainder. Otherwise go to step 2.
- 5. Stop the program execution.

ADDRESS	OPCODE	LABEL	MNEMONICS	OPERAN	COMMENTS
4100			MVI	D B,00	Clear B reg for quotient
4101			141 4 1	D ,00	Clear B leg for quotient
4102			LXI	H,4200	Initialize HL reg. to
4103				11,1200	4500H
4104					
4105			MOV	A,M	Transfer dividend to acc.
4106			INX	Н	Increment HL reg. to point
					next mem. Location.
4107		LOOP	SUB	M	Subtract divisor from
					dividend
4108			INR	В	Increment B reg
4109			JNC	LOOP	Jump to LOOP if result
410A			- 111-		does not yield borrow
410B			ENGINE	ERIA	
410C			ADD	M	Add divisor to acc.
410D		4	DCR	В	Decrement B reg
410E		7	INX	H	Increment HL reg. to point
			SRM		next mem. Location.
410F		A	MOV	M,A	Transfer the remainder from
		>			acc. to memory.
4110			INX	H	Increment HL reg. to point
					next mem. Location.
4111			MOV	M,B	Transfer the quotient from
			1		B reg. to memory.
4112			HLT		Stop the program

OBSERVATION:

IN	PUT	OUT	TPUT
ADDRESS	DATA	ADDRESS	DATA
4200		4202	
4201		4203	

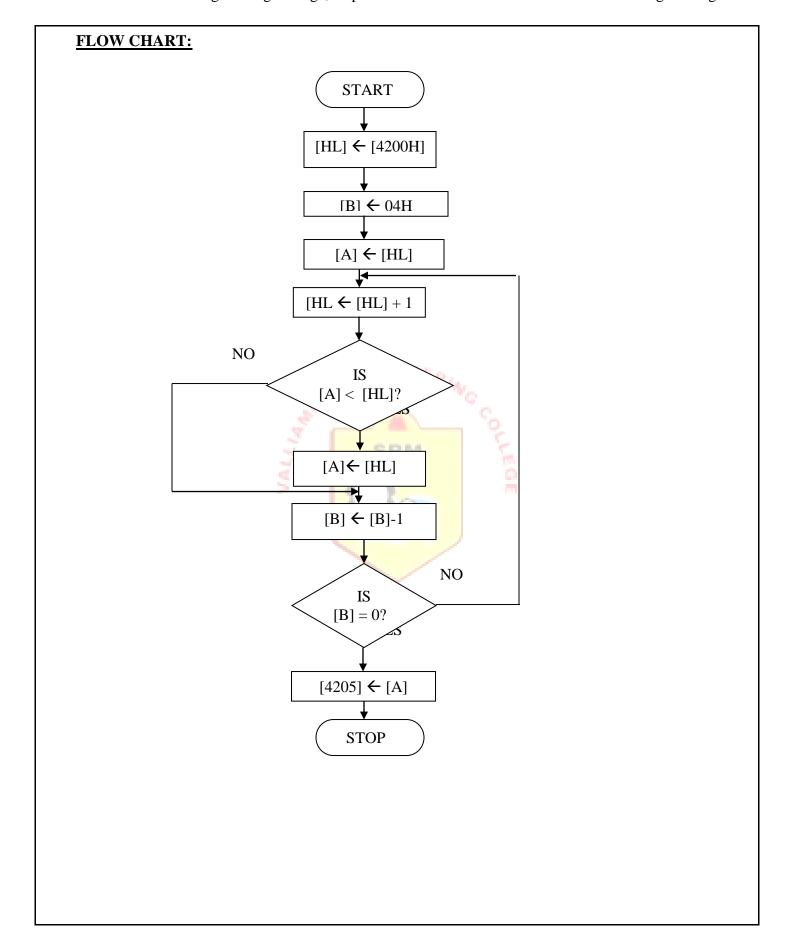

RESULT:

Thus an ALP was written for 8-bit division and also the result is also verified.

SRM

VIVA QUESTIONS:

- 1. What SUB M instruction will do?
- 2. Describe SBB M instruction
- 3. Express the use of SUI with an example
- 4. Where SBI can be used?
- 5. Give the purpose of the instruction LDAX D
- 6. How will you perform Division using ADD instruction?
- 7. What is the need of ALE signal in 8085?
- 8. What are the addressing modes of 8085?
- 9. List the interrupt signals of 8085?

2(A) LARGEST ELEMENT IN AN ARRAY

AIM:

To find the largest element in an array of data stored in memory and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Place all the elements of an array in the consecutive memory locations.
- 2. Fetch the first element from the memory location and load it in the accumulator.
- 3. Initialize a counter (register) with the total number of elements in an array.
- 4. Decrement the counter by 1.
- 5. Increment the memory pointer to point to the next element.
- 6. Compare the accumulator content with the memory content (next element).
- 7. If the accumulator content is smaller, then move the memory content (largest element) to the accumulator. Else continue.
- 8. Decrement the counter by 1.
- 9. Repeat steps 5 to 8 until the counter reaches zero
- 10. Store the result (accumulator content) in the specified memory location.

ADDRESS	OPCODE	LABEL	MNEMONICS	OPERAND	COMMENTS
4100			LXI	H,4200	Initialize HL reg. to
4101					8100H
4102					
4103			MVI	B,04	Initialize B reg with no.
4104					of comparisons(n-1)
4105			MOV	A,M	Transfer first data to acc.
4106		LOOP1	INX	Н	Increment HL reg. to
					point next memory
					location
4107			CMP	M	Compare M & A
4108			JNC	LOOP	If A is greater than M
4109					then go to loop
410A					
410B			MOV	A,M	Transfer data from M to
			EMPINEER	la.	A reg
410C		LOOP	DCR	G B	Decrement B reg
410D		45	JNZ	LOOP1	If B is not Zero go to
410E		3 1		- 7	loop1
410F		77	SRM	150	
4110		, A	STA	4205	Store the result in a
4111			1 1		memory location.
4112	·				
4113			HLT		Stop the program

OBSERVATION:

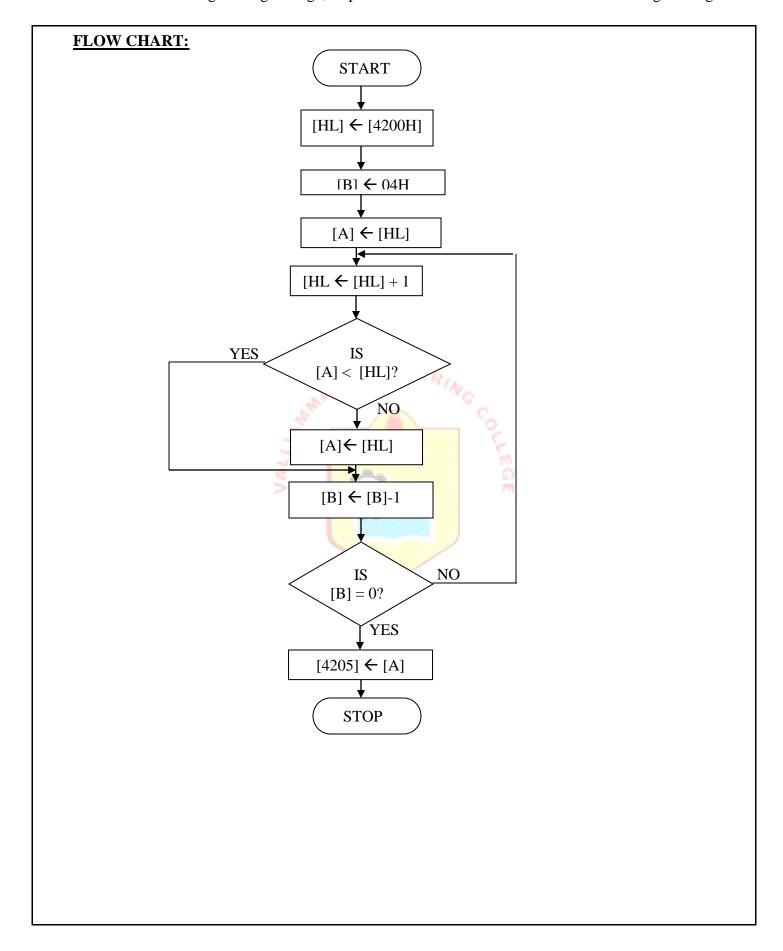

INP	UT	OUTPUT		
ADDRESS	DATA	ADDRESS	DATA	
4200		4205		
4201				
4202				
4203				
4204				

RESULT:

Thus the largest number in the given array is found and it is stored at location 4205.

VIVA QUESTIONS:

- 1. What is meant by the instruction CMP M SRIM
- 2. What the instruction JNZ will do
- 3. State the logic behind the finding of largest element
- 4. List out the similarities b/w the CALL-RET and PUSH-POP instructions?
- 5. What is the need of ALE signal in 8085?
- 6. What are the addressing modes of 8085?

2(B) SMALLEST ELEMENT IN AN ARRAY

AIM:

To find the smallest element in an array of data stored in memory and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

ALGORITHM:

- 1. Place all the elements of an array in the consecutive memory locations.
- 2. Fetch the first element from the memory location and load it in the accumulator.
- 3. Initialize a counter (register) with the total number of elements in an array.
- 4. Decrement the counter by 1.
- 5. Increment the memory pointer to point to the next element.
- 6. Compare the accumulator content with the memory content (next

element).

- 7. If the accumulator content is smaller, then move the memory content (largest element) to the accumulator. Else continue.
- 8. Decrement the counter by 1.
- 9. Repeat steps 5 to 8 until the counter reaches zero
- 10. Store the result (accumulator content) in the specified memory location.

RESULT:

Thus the smallest number in the given array is found and it is stored at location 4205.

VIVA QUESTION:

- 1. What is meant by instruction JC?
- 2. Tell about the instruction SHLD.
- 3. Summarize the instruction STAX B.
- 4. State the logic behind the finding of smallest element.
- 5. Why address bus is unidirectional?
- 6. List few instructions to clear accumulator?
- 7. What is the function of NOP instruction?

3(A) ASCENDING ORDER

AIM:

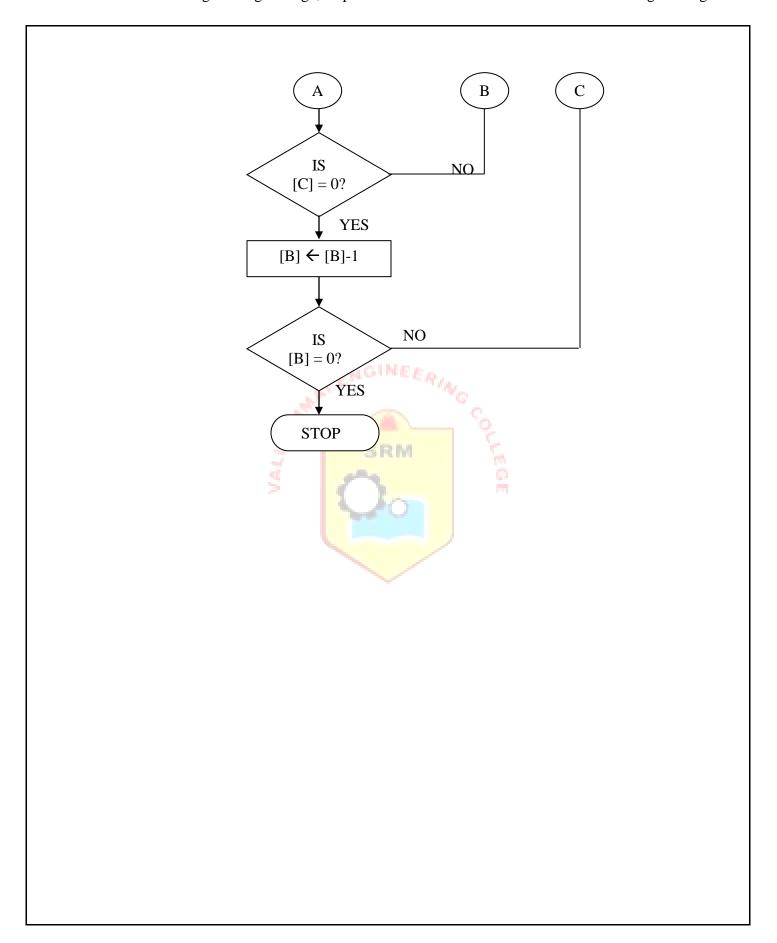

To sort the given numbers in the ascending order using 8085 microprocessor.

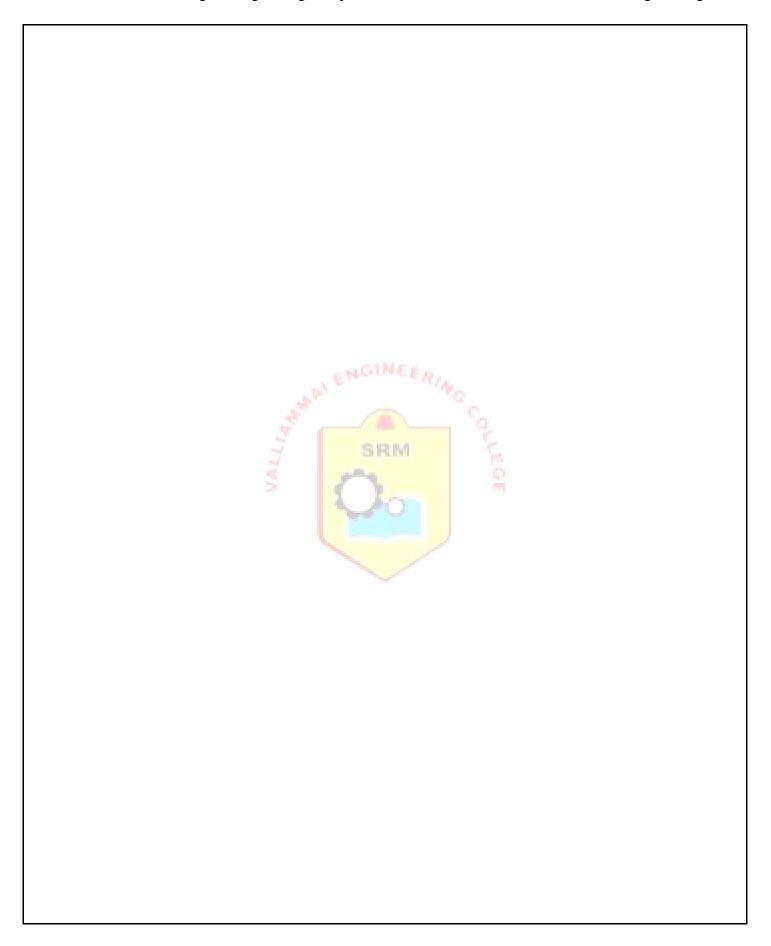

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Get the numbers to be sorted from the memory locations.
- 2. Compare the first two numbers and if the first number is larger than second then interchange the number.
- 3. If the first number is smaller, go to step 4
- 4. Repeat steps 2 and 3 until the numbers are in required order

ADDRES S	OPCODE	LABEL	MNEMONICS	OPERAND	COMMENTS

4204		4204		

RESULT:

Thus the ascending order program is executed and the numbers are arranged in ascending order.

VIVA QUESTION:

- 1. Explain INX operation
- 2. State the logic behind the Sorting an array of data in Descending order
- 3. What are the advantages of using memory segmentation 8085?
- 4. What is the macro & when it is used?
- 5. What is the function of direction flag?
- 6. What is DMA?
- 7. Define machine cycle and instruction cycle?

3(B) DESCENDING ORDER

AIM:

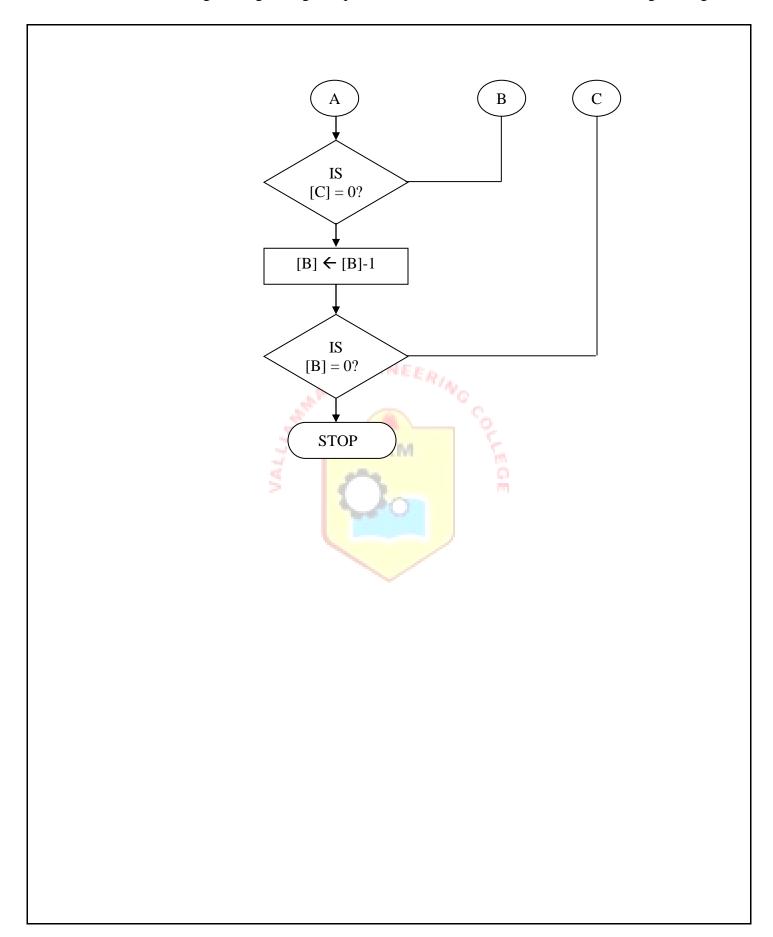

To sort the given numbers in the descending order using 8085 microprocessor.

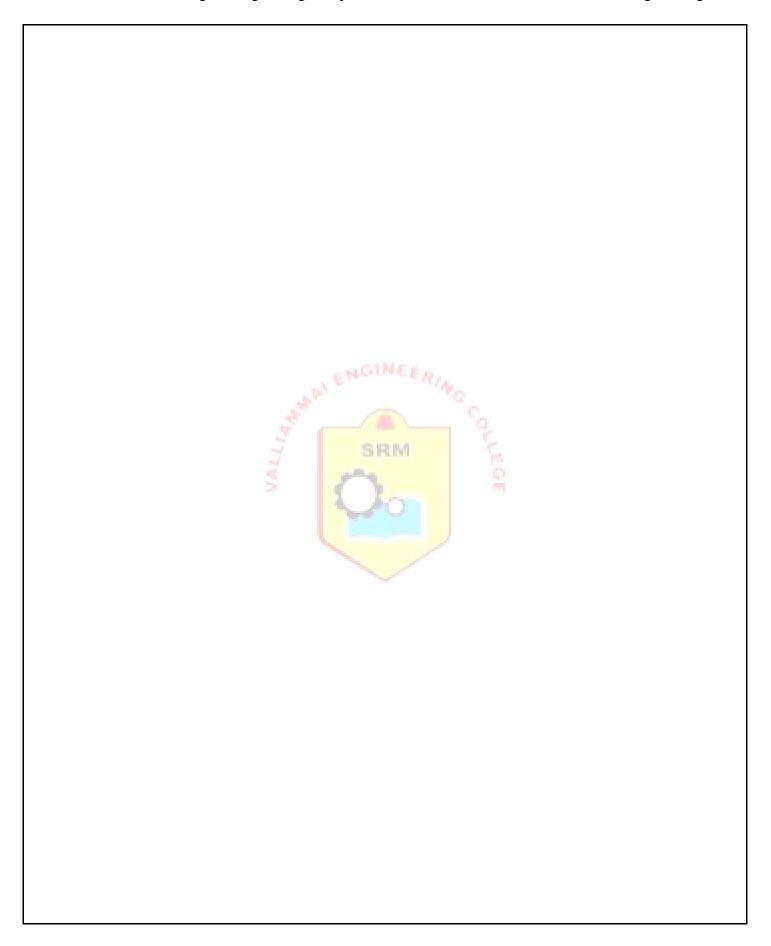

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

- 1. Get the numbers to be sorted from the memory locations.
- 2. Compare the first two numbers and if the first number is smaller than second then interchange the number.
- 3. If the first number is larger, go to step 4. **GINE EA
- 4. Repeat steps 2 and 3 until the numbers are in required order

RESULT:

Thus the descending order program is executed and the numbers are arranged in descending order.

VIVA QUESTION:

- 1. Give out the purpose of the instruction DCX
- 2. What is meant by CALL instruction?
- 3. Briefly give out the LHLD instruction
- 4. State the logic behind the Sorting an array of data in Descending order
- 5. Name the various flag bits available in 8085 microprocessor?
- 6. Give the significance of SIM and RIM instructions available in 8085?
- 7. How do the address and data lines are demultiplexed in 8085?

4(A) CODE CONVERSION - DECIMAL TO HEXADECIMAL

AIM:

To convert a given decimal number to hexadecimal number.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

ALGORITHM:

- 1. Initialize the memory location to the data pointer.
- 2. Increment B register.
- 3. Increment accumulator by 1 and adjust it to decimal every time.
- 4. Compare the given decimal number with accumulator value.
- 5. When both matches, the equivalent hexadecimal value is in B register.
- 6. Store the resultant in memory location.

- 6. What is physical address?
- 7. Define OFFSET address.

4(B) CODE CONVERSION - HEXADECIMAL TO DECIMAL

AIM:

To convert a given hexadecimal number to decimal number and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board.

ALGORITHM:

- 1. Initialize the memory location to the data pointer.
- 2. Increment B register.
- 3. Increment accumulator by 1 and adjust it to decimal every time.
- 4. Compare the given hexadecimal number with B register value.
- 5. When both match, the equivalent decimal value is in A register.
- 6. Store the resultant in memory location.

4(C). CODE CONVERSION –HEXADECIMAL TO ASCII

Aim

To write an assembly language program to covert the given Hexadecimal number into its ASCII equivalent and to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board.

Algorithm:

Step 1: Load the Hexadecimal number from the location

Step 2: Separate the nibbles

Step 3: Convert each nibble to its ASCII Equivalent.

Step 4: Add the two converted values

Step 5: Display the result

Step 6: Stop

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

MODE 1 STROBED I/O MODE:

In this mode, port A and port B are used as data ports and port C is used as control signals for strobed I/O data transfer.

Let us initialize port A as input port in mode1

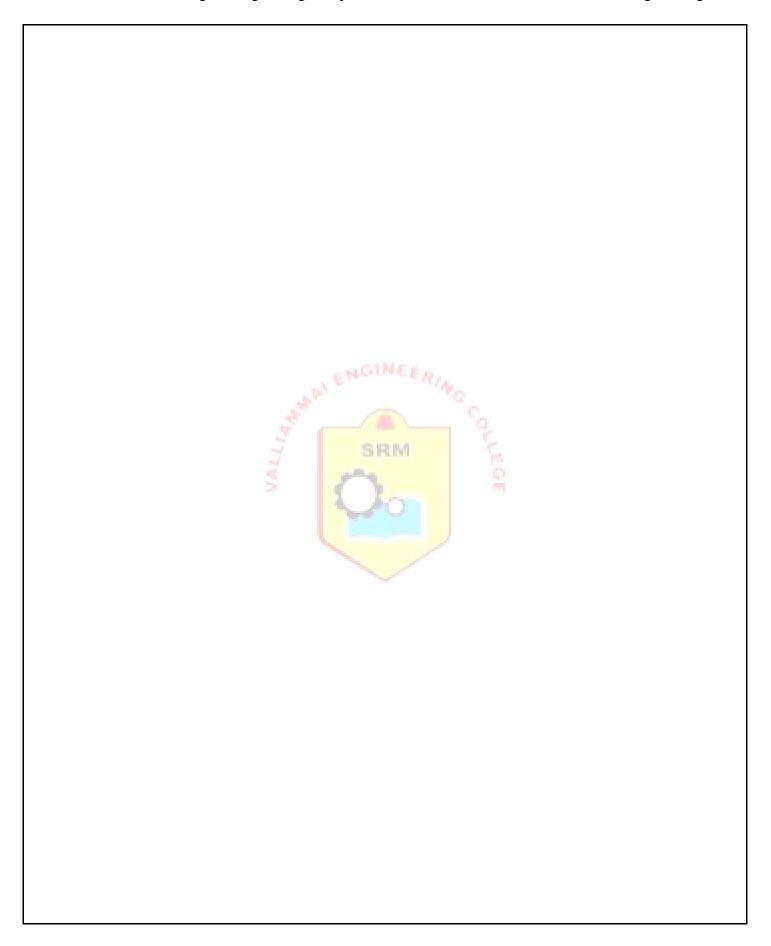

BSR MODE (Bit Set Reset mode

Any lines of port c can be set or reset individually without affecting other lines using this mode. Let us set PC0 and PC3 bits using this mode.

ALGORITHM:-

- 1. Start.
- 2. Write the control word to initialize 8255. Obtain the data for each direction and store in the memory.
- 3. Initialize a counter to indicate the number of directions.
- 4. Initialize HL Pair to the starting address of the data...
- 5. Check the result.
- 6. Decrement the counter and repeat step 3 till counter becomes 0
- 7. Stop

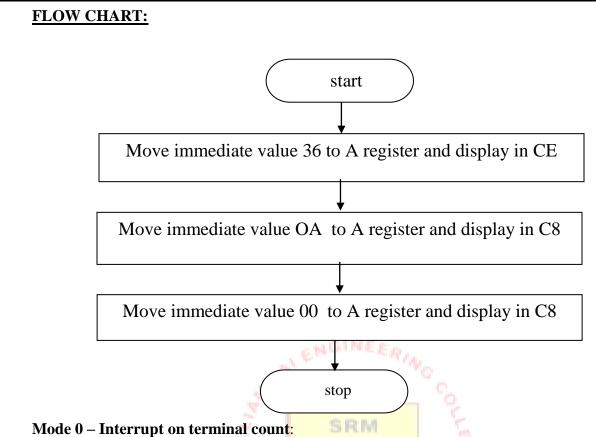

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

RESULT:

Thus the design of traffic light controller using 8085 microprocessor through programmable peripheral interface 8255is done and also the output is verified.

VIVA QUESTIONS:

- 1. When the 82C55 is reset, its I/O ports are all initializes as what?
- 2. If the programmable counter timer 8254 is set in mode 1 and is to be used to count six events, the output will remain at logic 0 for how many number of counts?
- 3. The devices that provide the means for a computer to communicate with the user or other computers are referred to as:
- 4. What is the maximum number of I\o devices which can be interfaced in the memory mapped I\O technique?
- 5. Interaction between a CPU and a peripheral device that takes place during and input output operation is known as what?
- 6. What is the other name for Programmable peripheral input-output port?
- 7. All the functions of the ports of 8255 are achieved by programming the bits of an internal register called what?
- 8. What is the port that is used for the generation of handshake lines in mode 1 or mode 2?
- 9. What is the pin that clears the control word register of 8255 when enabled?
- 10. In 8255 if A1=0, A0=1 then the input read cycle is performed from where?

6. INTERFACING 8253 TIMER WITH 8085

AIM:

To interface 8253 Interface board to 8085 µp and verify the operation of 8253 in six different modes.

APPARATUS REQUIRED:

8085 µp kit, 8253 Interface board, DC regulated power supply, VXT parallel bus, CRO.

Mode 0 – Interrupt on terminal count:

The output will be initially low after mode set operations. After loading the counter, the output will be remaining low while counting and on terminal count; the output will become high, until reloaded again.

Let us set the channel 0 in mode 0. Connect the CLK 0 to the debounce circuit by changing the jumper J3 and then execute the following program.

It is observed in CRO that the output of Channel 0 is initially LOW. After giving six clock pulses, the output goes HIGH.

Mode 1 – Programmable ONE-SHOT:

After loading the counter, the output will remain low following the rising edge of the gate input. The output will go high on the terminal count. It is retriggerable; hence the output will remain low for the full count, after any rising edge of the gate input.

Example:

The following program initializes channel 0 of 8253 in Mode 1 and also initiates triggering of Gate 0. OUT 0 goes low, as clock pulse after triggering the goes back to high level after 5 clock pulses. Execute the program, give clock pulses through the debounce logic and verify using CRO.

Mode 2 – Rate Generator:

It is a simple divide by N counter. The output will be low for one period of the input clock. The period from one output pulse to the next equals the number of input counts in the count register. If the count register is reloaded between output pulses the present period will not be affected but the subsequent period will reflect the new value

Example:

Using Mode 2, Let us divide the clock present at Channel 1 by 10. Connect the CLK1 to PCLK.

In CRO observe simultaneously the input clock to channel 1 and the output at Out1.

Mode 3 Square wave generator:

It is similar to Mode 2 except that the output will remain high until one half of count and go low for the other half for even number count. If the count is odd, the output will be high for (count + 1)/2 counts. This mode is used of generating Baud rate for 8251A (USART).

Example:

We utilize Mode 0 to generate a square wave of frequency 150 KHz at channel 0.

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

Mode 2 – Rate Generator:

Program:

Address	Opcodes	Label	Mnemonic	Operands	Comments
4100	3E 74	START:	MVI	A, 74	Channel 1 in mode 2
4102	D3 CE		OUT	CE	Send Mode Control word

410A			OUT	C8	Write count to register
410C			MVI	A, B8	Channel 2 in Mode 4
410E			OUT	CE	Send Mode control Word
4110			MVI	A, 98	LSB of Count
4112			OUT	CC	Write Count to register
4114			MVI	A, 3A	MSB of Count
4116			OUT	CC	Write Count to register
4118			HLT		

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

Set the jumper, so that the clock 0 of 8253 is given a square wave of frequency 1.5 MHz. This program divides this PCLK by 10 and thus the output at channel 0 is 150 KHz.

Vary the frequency by varying the count. Here the maximum count is FFFF H. So, the square wave will remain high for 7FFF H counts and remain low for 7FFF H counts. Thus with the input clock frequency of 1.5 MHz, which corresponds to a period of 0.067 microseconds, the resulting square wave has an ON time of 0.02184 microseconds and an OFF time of 0.02184 microseconds.

To increase the time period of square wave, set the jumpers such that CLK2 of 8253 is connected to OUT 0. Using the above-mentioned program, output a square wave of frequency 150 KHz at channel 0. Now this is the clock to channel 2.

Mode 4: Software Triggered Strobe:

The output is high after mode is set and also during counting. On terminal count, the output will go low for one clock period and becomes high again. This mode can be used for interrupt generation.

The following program initializes channel 2 of 8253 in mode 4.

Example:

Connect OUT 0 to CLK 2 (jumper J1). Execute the program and observe the output OUT 2. Counter 2 will generate a pulse after 1 second.

Mode 5 Hardware triggered strobe:

Counter starts counting after rising edge of trigger input and output goes low for one clock period when terminal count is reached. The counter is retriggerable.

Example:

The program that follows initializes channel 0 in mode 5 and also triggers Gate 0. Connect CLK 0 to debounce circuit.

Execute the program. After giving Six clock pulses, you can see using CRO, the initially HIGH output goes LOW. The output (OUT 0 pin) goes high on the next clock pulse.

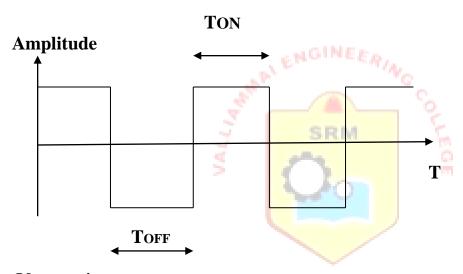

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

Mode 5 Hardware triggered strobe:

Program:

Address	Opcode	Label	Mnemonic	Operands	Comments
4100		START:	MVI	A, 1A	Channel 0 in mode 5
4102			OUT	CE	Send Mode Control word
4104			MVI	A, 05	LSB of count
4106			OUT	C8	Write count to register
4108			MVI	A, 00	MSB of count
410A			OUT	D0	Trigger Gate 0
410C			HLT		

OUTPUT: SQUARE WAVE:

Observation:

Ton:

Toff:

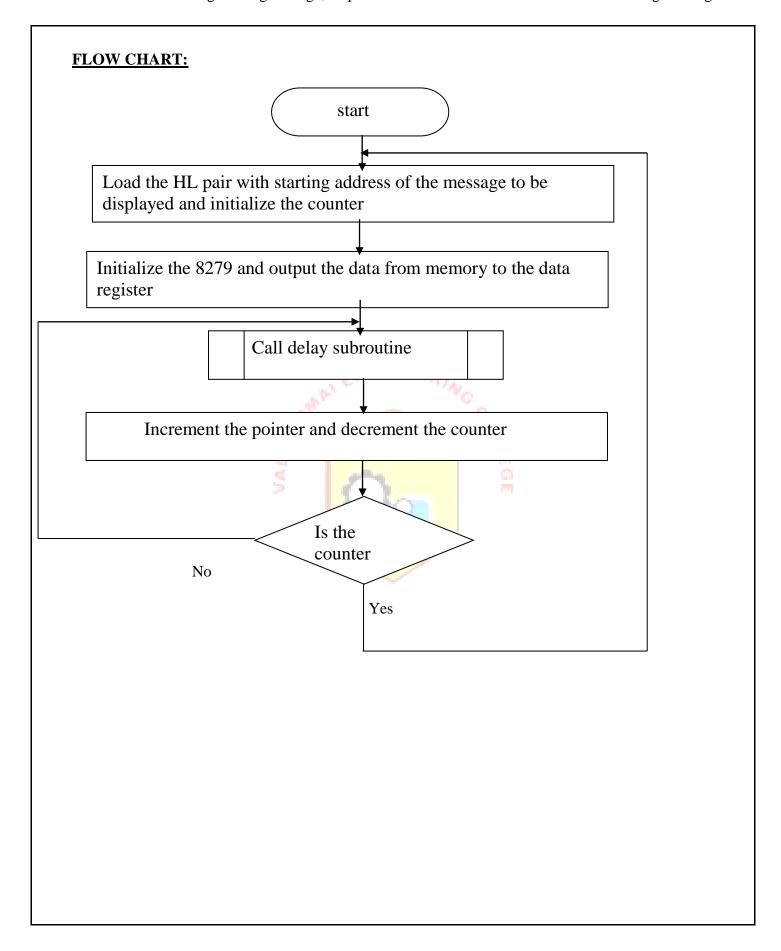

T=TON+TOFF FREQUENCY=1/T

RESULT:

Thus the 8253 has been interfaced to $8085~\mu p$ and six different modes of 8253 have been studied.

VIVA QUESTIONS:

- 1. If the crystal oscillator is operating at 15 MHz, what is the PCLK output of 8283?
- 2. By what factor does the 8284A clock generator divide the crystal oscillator's output frequency?
- 3. What is number of counters that are present in the programmable timer device 8254?
- 4. What is the operation that can be performed on control word register?
- 5. What is the mode that is used to interrupt the processor by setting a suitable terminal count?
- 6. In mode 2, if N is loaded as the count value, then after (N-1) cycles, the output becomes low for how many cycles?
- 7. In which mode the generation of square wave is possible?
- 8. In control word register, if SC1=0 and SC0=1, then the counter selected is what?
- 9. In control word format, if RL1=1, RL0=1 then the operation performed is what?
- 10. If BCD=0, then the operation is what in 8253?

7 INTERFACING 8279 – KEYBOARD / DISPLAY CONTROLLER WITH 8085 MICROPROCESSOR

AIM:

To write an assembly language program to interface keyboard and display controller IC 8279 with 8085 microprocessor.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board.and 8279 kit.

ALGORITHM:

- 1. Start
- 2. Initialize the accumulator.
- 3. Load the appropriate command words in control register.
- 4. Load the appropriate words for the characters to be displayed, in the accumulator in analog form.
- 5. Send the converted data to 8279 display.
- 6. Stop.

8 INTERFACING 8251 USART TO 8085 MICROPROCESSOR

AIM

To write an assembly language program to interface 8251 with 8085 Microprocessor and to transmit and receive data serially through 8251.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board and 8251 kit.

ALGORITHM

- 1. To Transmit Data serially, initialize a counter.
- 2. Load the 16-bit count in the counter.
- 3. Load the control word in 8251.
- 4. Send the data to 8251.
- 5. Halt.
- ENGINEER/NG CO 6. To receive data serially, get the data from 8251.
- 7. Save the data in memory.
- 8. Halt

INTERFACING 8251 USART

OUTPUT

Memory address	Output value
4150	

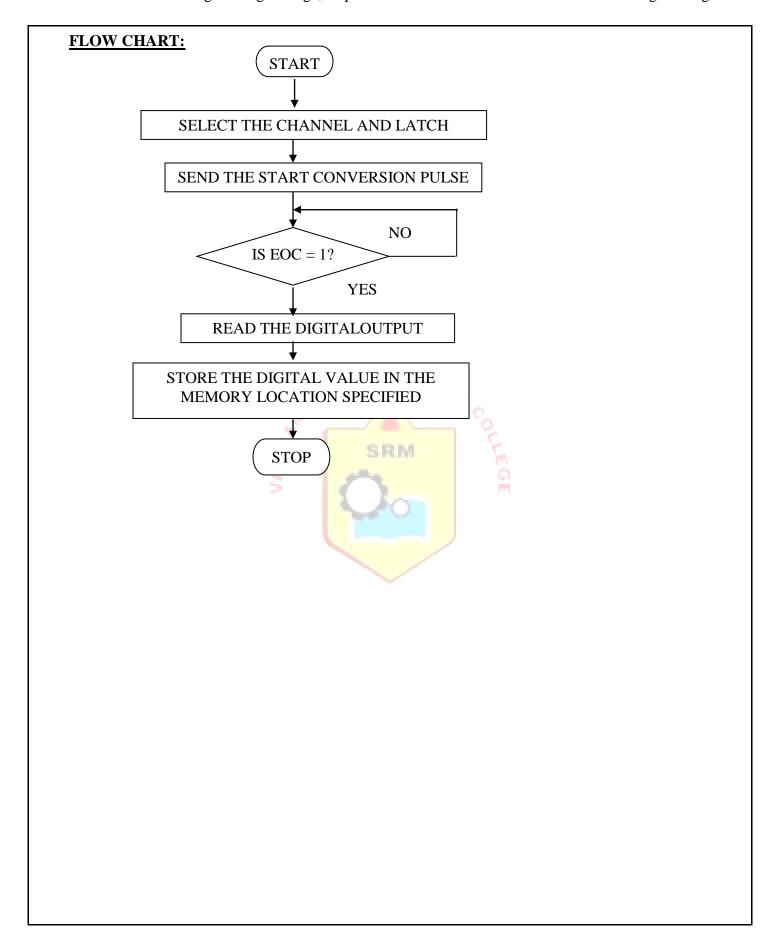

RESULT:

Thus an assembly language program was written to interface 8251with 8085 microprocessor. It was executed and the output was verified.

VIVA QUESTIONS:

VI	VA QUESTIONS:
	What is meant by 8251?
1.	What is meant by 8251?
2.	Which of the following is not a mode of data transmission?
	a) simplex b) duplex c) semi duplex d) half duplex
3.	If the data is transmitted only in one direction over a single communication channel, then it
	is ofmode.
1 .	If the data transmission takes place in either direction, but at a time data may be transmitted
	only in one direction then, it is ofmode.
5.	In 8251A, what is the pin that controls the rate at which the character is to be transmitted.
5.	TXD(Transmitted Data Output) pin carries serial stream of the transmitted data bits along
	with
7.	The signal that may be used either to interrupt the CPU or polled by the CPU is
3.	What are the disadvantage of RS-232C?
€.	The USB supports the signaling rate of
10	What is the bit packet that commands the device either to receive data or transmit data in

transmission of USB asynchronous communication?

9 INTERFACING ANALOG TO DIGITAL CONVERTER

AIM:

To write an assembly language program to convert an analog signal into a digital signal using an ADC interfacing.

APPARATUS REQUIRED:

SL.NO	ITEM	SPECIFICATION	QUANTITY
1.	Microprocessor kit	8085	1
2.	Power Supply	+5 V dc,+12 V dc	1
3.	ADC Interface board	-	1

PROBLEM STATEMENT:

The program is executed for various values of analog voltage which are set with the help of a potentiometer. The LED display is verified with the digital value that is stored in a memory location.

THEORY:

An ADC usually has two additional control lines: the SOC input to tell the ADC when to start the conversion and the EOC output to announce when the conversion is complete. The following program initiates the conversion process, checks the EOC pin of ADC 0809 as to whether the conversion is over and then inputs the data to the processor. It also instructs the processor to store the converted digital data at RAM location.

ALGORITHM:

- Select the channel and latch the address.
- 2. Send the start conversion pulse.
- 3. Read EOC signal.
- 4. If EOC = 1 continue else go to step (3)
- 5. Read the digital output.
- 6. Store it in a memory location.

ADDRESSS	LABEL	OPCODE	PROGRAM	COMMENTS
4100			MVI A,10H	Select channel
4102			OUT C8	Send through output port
4103			MVI A,18H	Load accumulator with value for ALE low
4105			OUT C8	Send through output port
4106			MVI A,01H	Store the value to make SOC high in the accumulator
4108			OUT 00H	Send through output port
4109			XRA A	
410A		ENG	XRA A	Introduce delay
410B		4	XRA A	
410C	1	S	MVI A,00	Store the value to make SOC low the accumulator
410E	A	984	OUT D0H	Send through output port
410F	L1		IN D8H	
4110			ANI 01	Read the EOC signal from
4112			CPI 01	port & check for end of conversion
4114			JNZ L1	If the conversion is not yet completed, read EOC signal from port again
4117			IN C0H	Read data from port
4118			STA 4150H	Store the data
411B			HLT	Stop

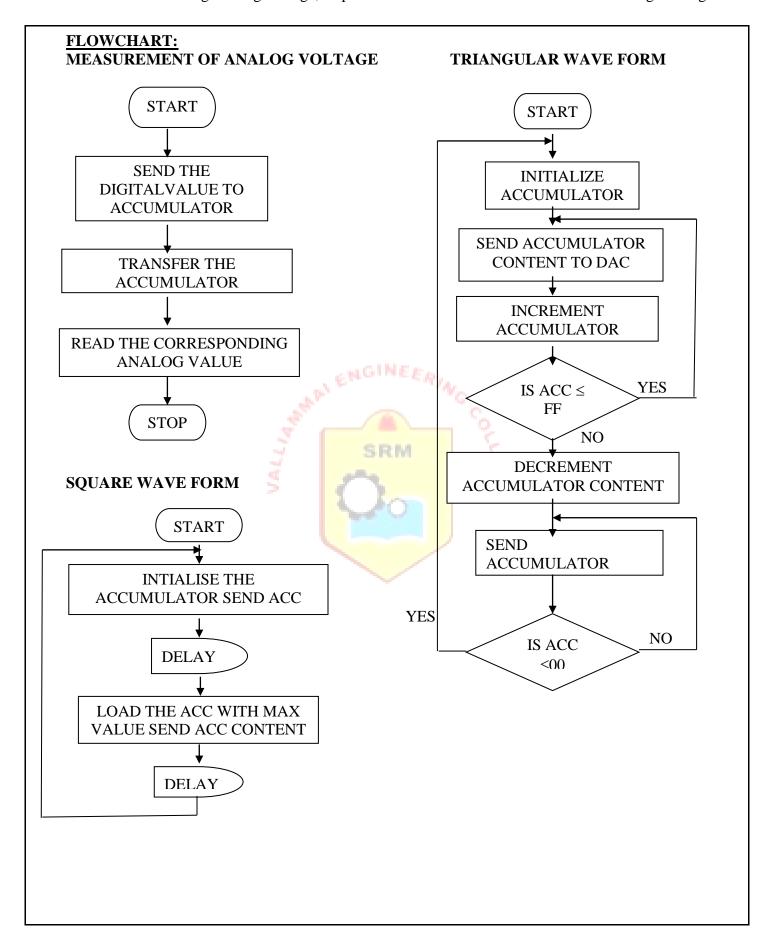

OBSERVATION:

ANALOG	DIGITAL DATA ON LED	HEX CODE IN MEMORY
VOLTAGE (V)	DISPLAY	LOCATION
5	1111 1111	FF
0	0000 0000	00
2.5	1000 0000	80

RESULT:

Thus the ADC was interfaced with 8085and the given analog inputs were converted into its digital equivalent.

- 1. What is the name given to time taken by the ADC from the active edge of SOC(start of conversion) pulse till the active edge of EOC(end of conversion) signal?
- 2. What are the popular technique that is used in the integration of ADC chips?
- 3. The procedure of algorithm for interfacing ADC contain ______.
- 4. Which is the ADC among the following?
 - a) AD 7523
- b) 74373
- c) 74245
- d) ICL7109
- **5.** The conversion delay in successive approximation of an ADC 0808/0809 is ______.
- 6. The number of inputs that can be connected at a time to an ADC that is integrated with successive approximation is ______.
- 7. ADC 7109 integrated by Dual slope integration technique is used for _____
- **8.** Which of the following is not one of the phase of total conversion cycle?
- 9. Which of the following phase contain feedback loop in it?_____
 - a) auto zero phase b) signal integrate phase
 - c) deintegrate phase d) none
- 10. In the signal integrate phase, the differential input voltage between IN LO(input low) and IN HI(input high) pins is integrated by the internal integrator for a fixed period of ______.

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

10 INTERFACING DIGITAL TO ANALOG CONVERTER

AIM:

- 1. To write an assembly language program for digital to analog conversion
- 2. To convert digital inputs into analog outputs & to generate different waveforms

APPARATUS REQUIRED:

SL.NO	ITEM	SPECIFICATION	QUANTITY
1.	Microprocessor kit	8086 Vi Microsystems	1
2.	Power Supply	+5 V, dc,+12 V dc	1
3.	DAC Interface board	-	1

PROBLEM STATEMENT:

The program is executed for various digital values and equivalent analog voltages are measured and also the waveforms are measured at the output ports using CRO.

ENGINEER!

THEORY:

Since DAC 0800 is an 8 bit DAC and the output voltage variation is between –5v and +5v. The output voltage varies in steps of 10/256 = 0.04 (approximately). The digital data input and the corresponding output voltages are presented in the table. The basic idea behind the generation of waveforms is the continuous generation of analog output of DAC. With 00 (Hex) as input to DAC2 the analog output is –5v. Similarly with FF H as input, the output is +5v. Outputting digital data 00 and FF at regular intervals, to DAC2, results in a square wave of amplitude 5v. Output digital data from 00 to FF in constant steps of 01 to DAC2. Repeat this sequence again and again. As a result a saw-tooth wave will be generated at DAC2 output. Output digital data from 00 to DAC2. Repeat this sequence again and again. As a result a triangular wave will be generated at DAC2 output.

ALGORITHM:

Measurement of analog voltage:

- 1. Send the digital value of DAC.
- 2. Read the corresponding analog value of its output.

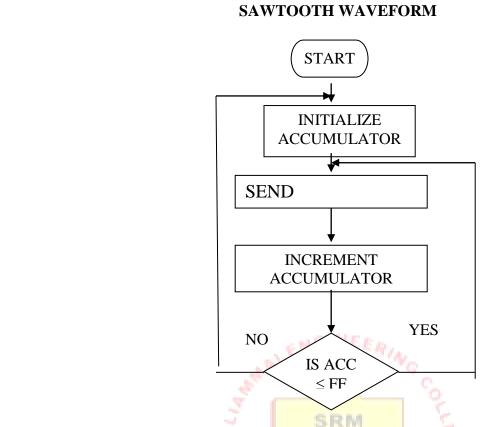

Waveform generation:

Square Waveform:

- 1. Send low value (00) to the DAC.
- 2. Introduce suitable delay.
- 3. Send high value to DAC.
- 4. Introduce delay.
- 5. Repeat the above procedure.

Saw-tooth waveform:

- $\overline{1}$. Load low value (00) to accumulator.
- 2. Send this value to DAC.
- 3. Increment the accumulator.
- 4. Repeat step (2) and (3) until accumulator value reaches FF.
- 5. Repeat the above procedure from step 1.

PROGRAM: Measurement of Analog Voltage

13 STEPPER MOTOR INTERFACING WITH 8051

AIM:

To operate stepper motor by interfacing with 8051 microcontroller.

THEORY:

A motor in which the rotor is able to assume only discrete stationary angular position is a stepper motor. The rotary motion occurs in a step-wise manner from one equilibrium position to the next. Stepper Motors are used very wisely in position control systems like printers, disk drives, process control machine tools, etc.

The basic two-phase stepper motor consists of two pairs of stator poles. Each of the four poles has its own winding. The excitation of any one winding generates a North Pole. A South Pole gets induced at the diametrically opposite side. The rotor magnetic system has two end faces. It is a permanent magnet with one face as South Pole and the other as North Pole.

The Stepper Motor windings A1, A2, B1, B2 are cyclically excited with a DC current to run the motor in clockwise direction. By reversing the phase sequence as A1, B2, A2, B1, anticlockwise stepping can be obtained.

2-PHASE SWITCHING SCHEME:

In this scheme, any two adjacent stator windings are energized. The switching scheme is shown in the table given below. This scheme produces more torque.

ANTICLOCKWISE CLOCKWISE											
STEP	A1	A2	B1	B2	DATA	STEP	A1	A2	B1	B2	DATA
1	1	0	0	1	9h	\1/	1	0	1	0	Ah
2	0	1	0	1	5h	2	0	1	1	0	6h
3	0	1	1	0	6h	3	0	1	0	1	5h
4	1	0	1	0	Ah	4	1	0	0	1	9h

ADDRESS DECODING LOGIC:

The 74138 chip is used for generating the address decoding logic to generate the device select pulses, CS1 & CS2 for selecting the IC 74175. The 74175 latches the data bus to the stepper motor driving circuitry.

Stepper Motor requires logic signals of relatively high power. Therefore, the interface circuitry that generates the driving pulses use silicon darlington pair transistors. The inputs for the interface circuit are TTL pulses generated under software control using the Microcontroller Kit. The TTL levels of pulse sequence from the data bus is translated to high voltage output pulses using a buffer 7407 with open collector.

PROGRAM:

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

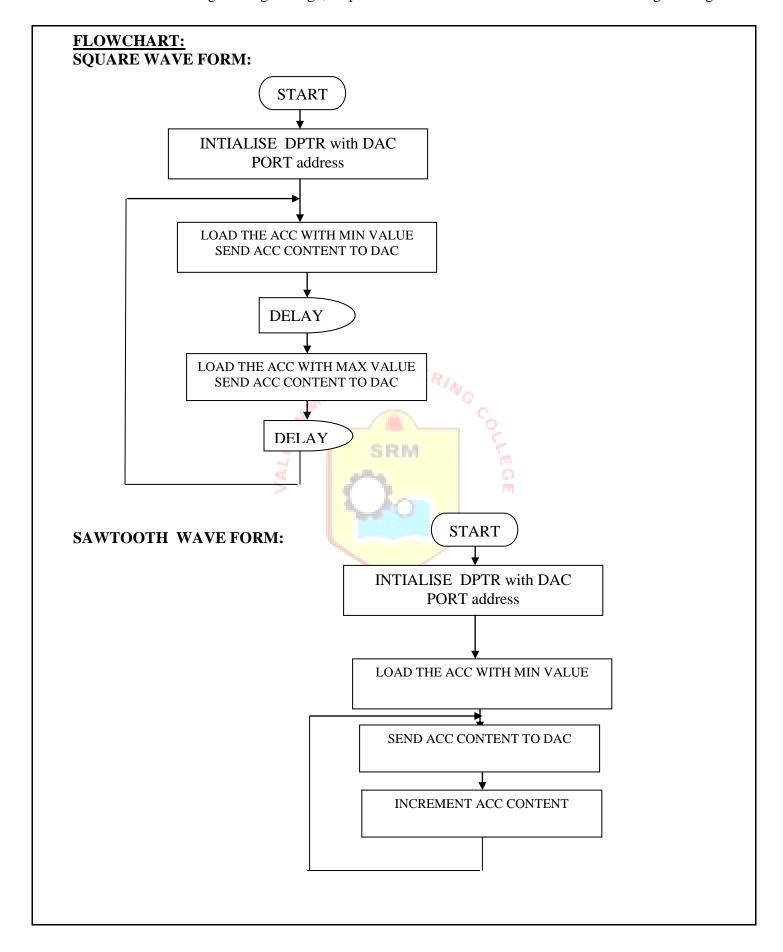

PROCEDURE:

- Enter the above program starting from location 4100 and execute the same. The stepper motor rotates.
- By varying the count at R4 and R5 can vary the speed.
- By entering the data in the look-up TABLE in the reverse order can vary direction of rotation.

RESULT:

Thus a stepper motor was interfaced with 8051 and run in forward and reverse directions at various speeds.

- 1. What are the application of stepper motor?
- 2. What is meant by step angle?
- 3. What are the methods to control the speed of stepper motor?
- 4. What is the formula for steps per revolution?

14 INTERFACING DAC WITH 8051

AIM:

To interface DAC with 8051 to demonstrate the generation of square wave, triangular wave and sawtooth wave

APPARATUS REQUIRED:

8051 microcontroller kit ,key board.

APPARATUS REQUIRED:

8051 Trainer Kit, DAC interface board

ALGORITHM:

SQUARE WAVE GENERATION:

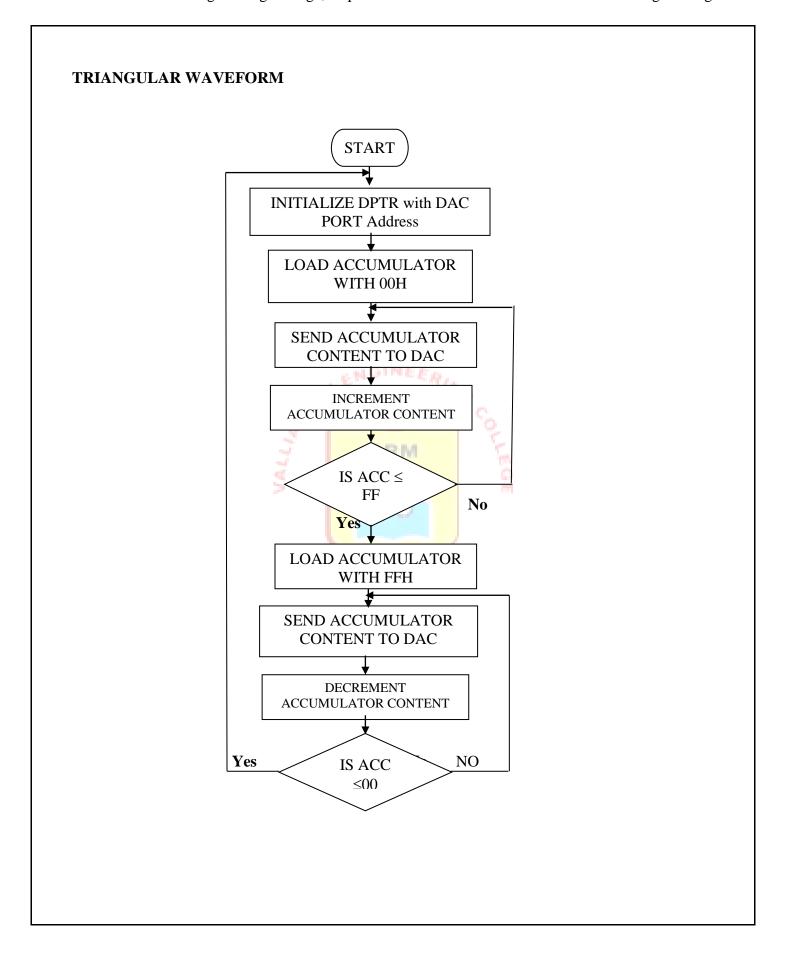

- 1. Move the port address of DAC to DPTR
- 2. load the initial value 00 TO accumulator and move it to DAC
- 3. CALL THE DELAY PROGRAM
- 4. Load the final value FF to accumulator and move it to DAC
- 5. Call the delay program
- 6. Repeat steps 2 to 5

SAWTOOTH WAVE GENERATION:

- 1. Move the port address of DAC to DPTR
- 2. Load the initial value 00 TO accumulator
- 3. Move the accumulator content to DAC
- 4. Increment the accumulator content by 1.
- 5. Repeat Steps 3 and 4

TRIANGULAR WAVE GENERATION

- 1. Move the port address of DAC to DPTR
- 2. Load the initial value (00) to Accumulator
- 3. Move the accumulator content to DAC
- 4. Increment the accumulator content by 1.
- 5. If accumulator content is zero proceed to next step. Else go to step 3.

- 6. Load value (FF) to Accumulator
- 7. Move the accumulator content to DAC
- 8. Decrement the accumulator content by 1.
- 9. If accumulator content is zero go to step2. Else go to step 7.

PROGRAM:

(A) Square Wave Generation

Address	Label	Mnemonics	Opcode	Comments
		ORG 4100H		
		MOV DPTR,PORT	G C.	MOV DPTR,PORT ADDRESS OF DAC
4100	START	MOV A,#00	9	Clear Accumulator
4102		MOVX @DPTR,A	7	Move A → DPTR
4103		LCALL DELAY	Q.E	Call delay
4104		MOV A,#FF		Load FF → A
4106		MOVX @DPTR,A		Move A → DPTR
4107		LCALL DELAY		Call delay
410A		LJUMP START		Jump to start
410D	DELAY:	MOV R1,#05		
410F	LOOP:	MOV R2,#FF		
4111	HERE:	DJNZ R2,HERE		Delay loop

410B		JNZ LOOP2		Jump not zero to location loop2
411E		LJMP START		Delay loop

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

RESULT:

Thus the square, triangular and saw tooth wave form were generated by interfacing DAC with 8051 trainer kit.

- 1. Briefly give the principle behind the triangular wave generation
- 2. What is settling or conversion time in DAC?
- 3. What are the internal devices of a typical DAC?.
- 4. What are Program and data memory size in 8051
- 5. How many 16 bit timers are available in 8051?
- 6. What is meant by SBUF?

15 INTERFACING OF LEDS AND SENSOR WITH ARDUINO /RASPBERRY PI MODULES

AIM:

To perform Interfacing of LEDs and sensor with arduino /raspberry pi modules **ARDUINO PROGRAMMING**

Arduino is a prototype platform (open-source) based on an easy-to-use hardware and software. It consists of a circuit board, which can be programed (referred to as a microcontroller) and a ready-made software called Arduino IDE (Integrated Development Environment), which is used to write and upload the computer code to the physical board.

The key features are:

- Arduino boards are able to read analog or digital input signals from different sensors and turn it into an output such as activating a motor, turning LED on/off, connect to the cloud and many other actions.
- You can control your board functions by sending a set of instructions to the microcontroller on the board via Arduino IDE (referred to as uploading software).
- Unlike most previous programmable circuit boards, Arduino does not need an extra piece of hardware (called a programmer) in order to load a new code onto the board. You can simply use a USB cable.
- Additionally, the Arduino IDE uses a simplified version of C++, making it easier to learn to program.
- Finally, Arduino provides a standard form factor that breaks the functions of the microcontroller into a more accessible package.

Fig: Arduino Board

Here are the components that make up an Arduino board and what each of their functions are.

- 1. Reset Button This will restart any code that is loaded to the Arduino board
- 2. AREF Stands for "Analog Reference" and is used to set an external reference voltage
- 3. Ground Pin There are a few ground pins on the Arduino and they all work the same
- 4. Digital Input/output Pins 0-13 can be used for digital input or output
- 5. PWM The pins marked with the (~) symbol can simulate analog output
- 6. USB Connection Used for powering up your Arduino and uploading sketches
- 7. TX/RX Transmit and receive data indication LEDs
- 8. ATmega Microcontroller This is the brains and is where the programs are stored
- 9. Power LED Indicator This LED lights up anytime the board is plugged in a power source
- 10. Voltage Regulator This controls the amount of voltage going into the Arduino board 11.DC

Power Barrel Jack – This is used for powering your Arduino with a power supply 12.3.3V Pin –

This pin supplies 3.3 volts of power to your projects

- 13.5V Pin This pin supplies 5 volts of power to your projects
- 14. Ground Pins There are a few ground pins on the Arduino and they all work the same
- 15. Analog Pins These pins can read the signal from an analog sensor and convert it to digital

SENSOR PROGRAMMING AND INTERFACE

```
void setup ()
{
  // put your setup code here, to run once:
}
void loop ()
{
  // put your main code here, to run repeatedly:
}
```

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

setup:

It is called only when the Arduino is powered on or reset. It is used to initialize variables andpin modes

loop:

The loop functions run continuously till the device is powered off. The main logic of the codegoes here. Similar to while (1) for micro-controller programming.

PinMode

• A pin on arduino can be set as input or output by using pinMode function.

```
pinMode (13, OUTPUT); // sets pin 13 as output pinpinMode
```

(13, INPUT); // sets pin 13 as input pin

Reading/writing digital values

```
digitalWrite(13, LOW);
```

// Makes the output voltage on pin 13, 0V

SRM

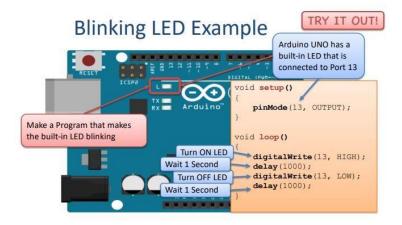

digitalWrite(13, HIGH);

// Makes the output voltage on pin 13, 5Vint

buttonState = digitalRead(2); /

/ reads the value of pin 2 in buttonState

PROGRAMMING

BLINKING OF LED IN ARDUINO BOARD

```
void setup()
  // initialize digital pin LED_BUILTIN as an output.
  pinMode(LED_BUILTIN, OUTPUT);
}
// the loop function runs over and over again forevervoid
loop()
  digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)
  delay(1000);
                          // wait for a second
  digitalWrite(LED_BUILTIN, LOW); // turn the LED off by making the voltage LOW
  delay(1000);
                           // wait for a second
}
                                          SRM
SERIAL PROGRAMMING USING ARDUINO:
void setup()
Serial.begin(9600);
void loop()
int i;
for(i=0; i<10; i++)Serial.println(i);
```

OUTPUT

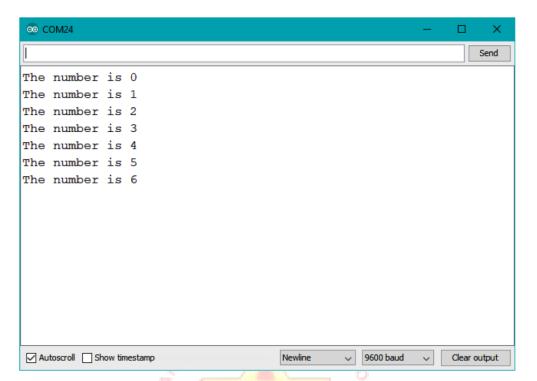

Fig: Serial Mon<mark>itor output for seria</mark>l programming

PROGRAMMING USING ULTRASONIC SENSOR INTERFACE

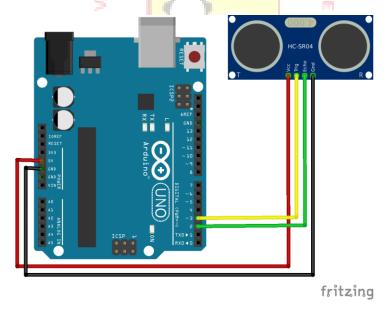

Fig: Ultrasonic Sensor Interface with Arduino

int trigPin= 9;

```
int echoPin= 10;void
setup ()
  pinMode(trigPin, OUTPUT);
  pinMode(echoPin, INPUT);
  Serial.begin(9600);
}
void loop ()
 //Serial.println("loop"); long
  duration, distance;
  digitalWrite(trigPin,HIGH);
  delayMicroseconds(1000);
  digitalWrite(trigPin, LOW);
  duration=pulseIn(echoPin, HIGH);
  distance = (duration/2)/29.1;
  Serial.print(distance);
 Serial.println("CM");
  delay(10);
PROGRAMMING USING IR SENSOR INTERFACE
```

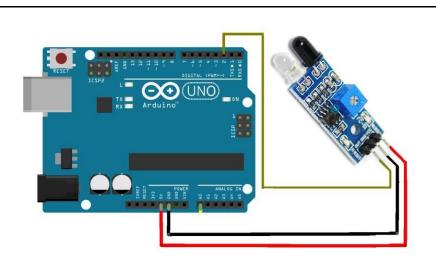

Fig:IR Sensor Interface with Arduino

```
#define s 7
#define led 13void
setup()
{
    pinMode(s,INPUT);
    pinMode(led, OUTPUT);

    // put your setup code here, to run once:
}
void on()
{
    digitalWrite(led,HIGH);
}
void off()
{
    digitalWrite(led,LOW);
}
```

```
void loop()
{
    if (digitalRead(s)==0)
    {
        on();
    }
    else
    {
        off();
    }
}
```

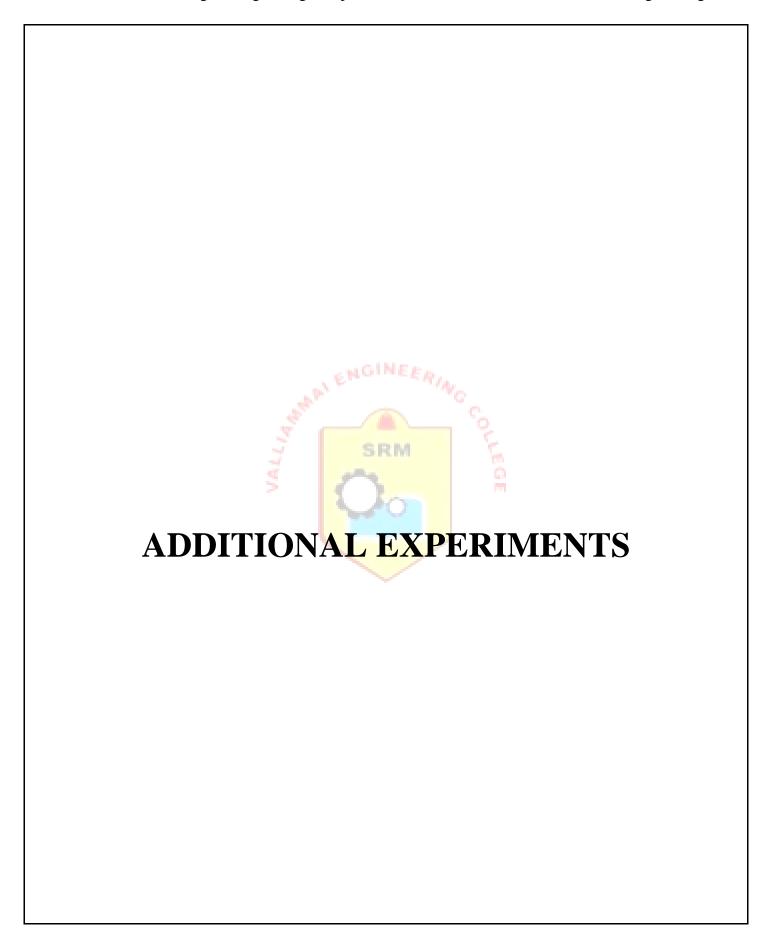

Result

Thus the Interfacing of LEDs and sensor with arduino /raspberry pi modules is done and the output is verified.

17 PROGRAMS TO VERIFY TIMER AND INTERRUPTS OPERATIONS IN 8051 MICROCONTROLLER

AIM:

To write ALP to generate a square wave of frequency, transfer a data serially from one kit to another and to verify the result.

APPARATUS REQUIRED:

8051 microcontroller kit ,key board.

a) Program to generate a square wave of frequency.

Steps to determine the count:

Let the frequency of sqaurewave to be generated be Fs KHz.

And the time period of the squarewave be Ts Sec.

Oscillator Frequency = 11.0592MHz.

One machine cycle = 12 clock periods

Time taken to complete one machine cycle= $12*(\frac{1}{11}.0592\text{MHz})=1.085\text{microsec}$.

Y(dec) = (Ts/2)/(1.085microsec)

Count(dec) = 65536(dec) - Y(dec)

= Count(hexa)

MOV TMOD,#10h ; To select timer1 & mode1 operation

L1: MOV TL1,#LOWERORDER BYTE OF THE COUNT

MOV TH1,#HIGHER ORDER BYTE OF THE COUNT

SETB TR1; to start the timer (TCON.6)

BACK: JNB TF1,BACK ; checking the status of timerflag1(TCON.7) for

overflow

CPL Px.x ; get the square wave through any of the portpins

; eg. P1.2 (second bit of Port 1)

CLR TR1; stop timer

CLR TF1 ; clear timer flag for the next cycle

SJMP L1

b) Program to transfer a data serially from one kit to another.

Transmitter:

MOV TMOD,#20H; Mode word to select timer1 & mode 2

MOV TL1,#FDH ; Initialize timer1 with the count

MOV TH1,#FFH

MOV SCON,#50H ; Control word for serial communication to

to select serial mode1

SETB TR1 ; Start timer1

MOV A,#06h

MOV SBUF,A ; Transfer the byte to be transmitted to serial

Buffer register.

LOOP: JNB TI, LOOP ; checking the status of Transmit interrupt

flag

SRM

CLR TI

HERE: SJMP HERE

Receiver:

MOV TMOD,#20H

MOV TL1,#FDH

MOV TH1,#FFH

MOV SCON,#50H

SETB TR1

LOOP: JNB RI,LOOP

MOV A,SBUF

MOV DPTR,#4500H

MOVX @DPTR,A

CLR RI

HERE: SJMP HERE

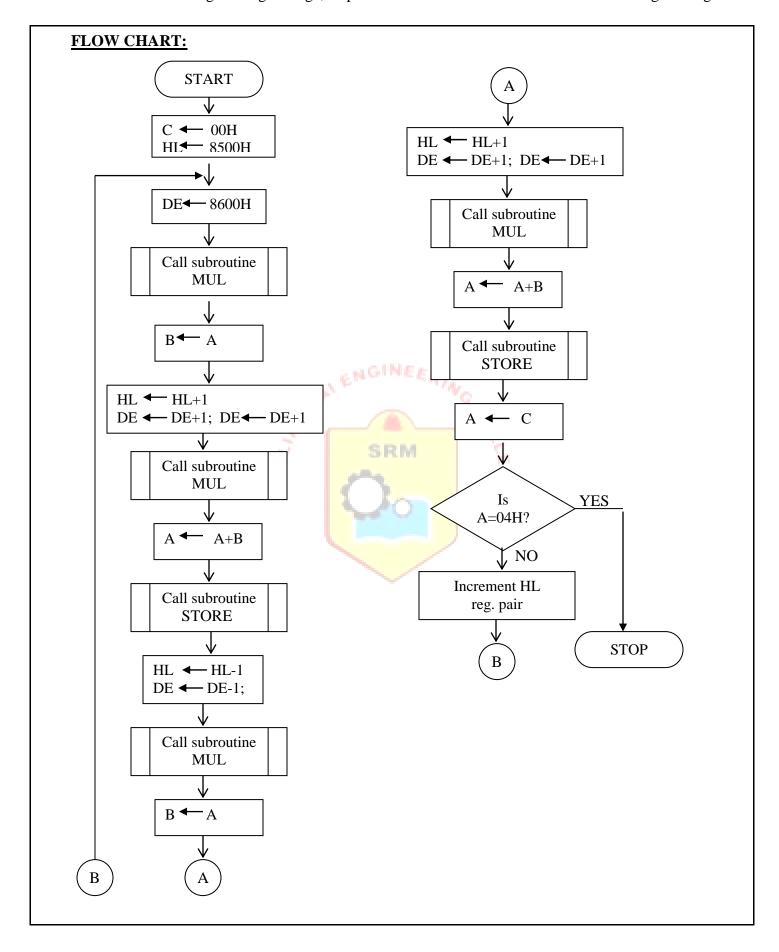

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

Result:

Thus ALP to generate a square wave of frequency, transfer a data serially from one kit to another and also the result is verified.

- 7. What is the function of IP register?

18 2 X 2 MATRIX MULTIPLICATION

AIM:

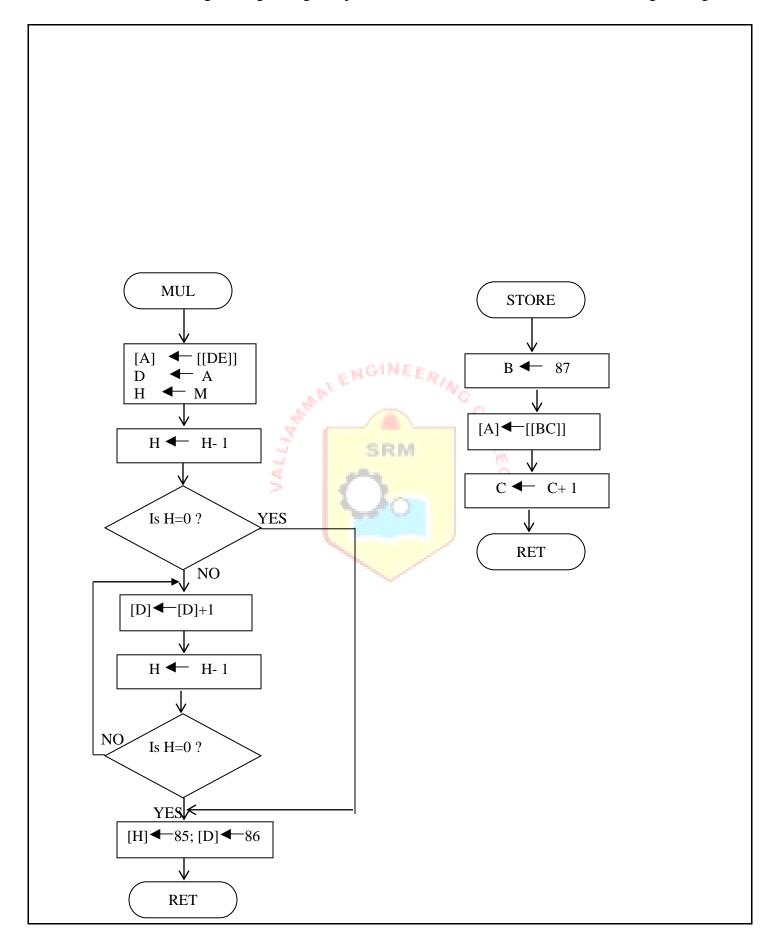

To perform the 2 x 2 matrix multiplication using 8085 microprocessor.

APPARATUS REQUIRED:

8085 microprocessor kit key board.

ALGORITHM:

- 1. Load the 2 input matrices in the separate address and initialize the HL and the DE register pair with the starting address respectively.
- 2. Call a subroutine for performing the multiplication of one element of a matrix with the other element of the other matrix.
- 3. Call a subroutine to store the resultant values in a separate matrix.
- 4. Halt

PROGRAM:

ADDRESS	OPCODE	LABEL	MNEMONCS	OPERAND	COMMENT
8100			MVI	C, 00	Clear C reg.
8101					_
8102			LXI	H, 8500	Initialize HL reg. to
8103					4500
8104					
8105		LOOP2	LXI	D, 8600	Load DE register pair
8106

8126			MOV	A,C	Transfer C register content

				to Acc.
8127		CPI	04	Compare with 04 to check
8128			<u> </u>	whether all elements are
0120				multiplied.
8129		JZ	LOOP1	If completed, go to loop1
812A				
812B				
812C		INX	Н	Increment HL register Pair.
812D		JMP	LOOP2	Jump to LOOP2.
812E				•
812F				
8130	LOOP1	HLT		Stop the program.
8131	MUL	LDAX	D	Load acc from the memory
				location pointed by DE pair.
8132		MOV	D,A	Transfer acc content to D
				register.
8133		MOV	H,M	Transfer from memory to H
				register.
8134		DCR	FR/AH	Decrement H register.
8135	-	JZ	LOOP3	If H is zero go to LOOP3.
8136	4		, o	
8137	74		- C	
8138	LOOP4	ADD	D	Add Acc with D reg
8139	⋖	DCR	H E	Decrement H register.
813A		JNZ	LOOP4	If H is not zero go to
813B		1		LOOP4.
813C				
813D	LOOP3	MVI	H,85	Transfer 85 TO H register.
813E				
813F		MVI	D,86	Transfer 86 to D register.
8140				
8141		RET		Return to main program.
8142	STORE	MVI	B,87	Transfer 87 to B register.
8143				
8144		STAX	В	Load A from memory
				location pointed by BC pair.
8145		INR	C	Increment C register.
8146		RET		Return to main program.

SRM Valliammai Engineering College, Department of Electronics and Instrumentation Engineering

OBSERVATION:

INPUT			OUTPUT	1
4500	4600		4700	
4501	4601		4701	
4502	4602		4702	
4503	4603		4703	

RESULT:

Thus the 2 x 2 matrix multiplication is performed and the result is stored at 4700,4701, 4702 & 4703.

- 1. How many loops needed to perform matrix multiplication?
- 2. What is the condition for two matrix is multipliable?
- 3. What is the use of the instruction RET?
- 4. What are conditional jump and unconditional jump instructions?
- 5. What is the next line will execute after Call instruction
- 6. Compare Call and DJNZ instructions?
- 7. If there is no RET statement after CALL instruction whether the program will come to end or not?
