SYLLABUS

OBJECTIVES:

- To perform simple arithmetic operations using assembly language program and study the addressing modes & instruction set of 8085 & 8051.
- To develop skills in simple program writing in assembly languages.
- To write an assembly language program to convert Analog input to Digitaloutput and Digital input to Analog output.
- To perform interfacing experiments with µP8085 and µC8051.
- To Program Arduino and Raspberry pi with software tools.

LIST OF EXPERIMENTS:

Programming exercises / Experiments with µP8085:	
1.	Simple arithmetic operations: Multi precision addition / subtraction / multiplication /division.
2.	Programming with control instructions: Increment / Decrement, Ascending Descendingorder, Maximum / Minimum of numbers, Rotate instructions, Hex /ASCII / BCD code conversions.
3.	Interface Experiments: A/D Interfacing. D/A Interfacing. Traffic light controller.
4.	Stepper motor controller interface.
5.	Displaying a moving/ rolling message in the student trainer kit's output device.
Programming exercises / Experiments with µC8051:	
6.	Simple arithmetic operations with 8051: Multi precision addition / subtraction / multiplication / division.
7.	Programming with control instructions: Increment / Decrement, Ascending / Descending order, Maximum / Minimum of numbers, Rotate instructions, Hex / ASCII / BCD code conversions.

8.	Interface Experiments: A/D Interfacing. D/A Interfacing. Traffic light controller
9.	Stepper motor controller interface.
10.	Programming Arduino with software tools.
11.	Programming Raspberry pi with software tools.

1(A) 8-BIT DATA ADDITION

AIM:

To add two 8 bit numbers stored at consecutive memory locations and also to verify the

result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory in accumulator.
3. Get the second number and add it to the accumulator.
4. Store the answer at another memory location.

RESULT:

Thus the two 8 bit numbers stored at 4200 &4201 are added and the result is stored at4202 & 4203.

VIVA QUESTIONS:

1. What is the function of LXI H, 4000 H instruction?
2. How you can store a data in a memory location?
3. What is the meaning of INX
3. How you can read a data from a memory location?
4. What are flags available in 8085 ?
5. What is the function of RESET key of a 8085 microprocessor kit
6. What is the function of JNC instruction?
7. What is the difference between conditional and unconditional jump instruction?
8. What is multi byte

1(B) 8-BIT DATA SUBTRACTION

AIM:

To subtract two 8 bit numbers stored at consecutive memory locations and also toverify the result.

APPARATUS REQUIRED:

8085 microprocessor kit, key board

ALGORITHM:

1. Initialize memory pointer to data location.
2. Get the first number from memory in accumulator.
3. Get the second number and subtract from the accumulator.
4. If the result yields a borrow, the content of the acc. is complemented and 01H is added to it (2's complement). A register is cleared and the content of that reg. is incremented in case there is a borrow. If there is no borrow the content of the acc. is directly taken asthe result.
5. Store the answer at next memory location.

PROGRAM:

VIVA QUESTIONS:

1. What is meant by ADI instruction
2. What is an instruction?
3. What is Mnemonic?
4. What is the purpose of CMA instruction?
5. What is the function of stack pointer?
6. Why ADI 01H is used in two's complement of an 8-bit number.

1(C) 8-BIT DATA MULTIPLICATION

AIM:

To multiply two 8 bit numbers stored at consecutive memory locations and also toverify the result.

APPARATUS REQUIRED:

8085 microprocessor kit , key board

ALGORITHM:

1. Initialize memory pointer to data location.
2. Move multiplicand to a register.
3. Move the multiplier to another register.
4. Clear the accumulator.
5. Add multiplicand to accumulator
6. Decrement multiplier
7. Repeat step 5 till multiplier comes to zero.
8. The result, which is in the accumulator, is stored in a memory location.

PROGRAM:

RESULT:

Thus the 8-bit multiplication was done in 8085 p using repeated addition method andalso the result is verified.

VIVA QUESTION:

1. Define two's complement of an 8-bit numbers.
2. What is meant by instruction ADC M?
3. What is the use of the instruction MOV A,M
4. What is the function of program counter?
5. Mention the types of 8085 instruction set.
6. How will you perform multiplication using ADD instruction?

1(D) 8-BIT DIVISION

AIM:

To divide two 8-bit numbers stored in memory and also to verify the result.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

ALGORITHM:

1. Load Divisor and Dividend.
2. Subtract divisor from dividend .
3. Count the number of times of subtraction which equals the quotient.
4. Stop subtraction when the dividend is less than the divisor .The dividend now becomesthe remainder. Otherwise go to step 2.
5. Stop the program execution.

2(A) LARGEST ELEMENTS IN AN ARRAY

AIM :

To find the largest element in an array of data stored in memory and also to verify the resut.

APPARATUS REQUIRED:

8085 microprocessor kit , key board

ALGORITHM:

1. Place all the elements of an array in the consecutive memory locations.
2. Fetch the first element from the memory location and load it in the accumulator.
3. Initialize a counter (register) with the total number of elements in an array.
4. Decrement the counter by 1.
5. Increment the memory pointer to point to the next element.
6. Compare the accumulator content with the memory content (next element).
7. If the accumulator content is smaller, then move the memory content(largest element) to the accumulator. Else continue.
8. Decrement the counter by 1.
9. Repeat steps 5 to 8 until the counter reaches zero
10. Store the result (accumulator content) in the specified memory location.

2(E) CODE CONVERSION - DECIMAL TO HEXADECIMAL

AIM:

To convert a given decimal number to hexadecimal number.

APPARATUS REQUIRED:

8085 microprocessor kit ,key board

ALGORITHM:

1. Initialize the memory location to the data pointer.
2. Increment B register.
3. Increment accumulator by 1 and adjust it to decimal every time.
4. Compare the given decimal number with accumulator value.

3A INTERFACING ANALOG TO DIGITAL CONVERTER

AIM:

To write an assembly language program to convert an analog signal into a digital signal using an ADC interfacing.

APPARATUS REQUIRED:

SL.NO	ITEM	SPECIFICATION	QUANTITY
1.	Microprocessor kit	8085	1
2.	Power Supply	+5 V dc,+12 V dc	1
3.	ADC Interface board	-	1

PROBLEM STATEMENT:

The program is executed for various values of analog voltage which are set with the help of a potentiometer. The LED display is verified with the digital value that is stored in a memory location.

THEORY:

An ADC usually has two additional control lines: the SOC input to tell the ADC when to start the conversion and the EOC output to announce when the conversion is complete. The following program initiates the conversion process, checks the EOC pin of ADC 0809 as to whether the conversion is over and then inputs the data to the processor. It also instructs the processor to store the converted digital data at RAM location.

ALGORITHM:

1. Select the channel and latch the address.
2. Send the start conversion pulse.
3. Read EOC signal.
4. If EOC = 1 continue else go to step (3)
5. Read the digital output.
6. Store it in a memory location.

3B INTERFACING DIGITAL TO ANALOG CONVERTER

AIM:

1. To write an assembly language program for digital to analog conversion
2. To convert digital inputs into analog outputs & to generate different waveforms

APPARATUS REQUIRED:

SL.NO	ITEM	SPECIFICATION	QUANTITY
1.	Microprocessor kit	8086 Vi Microsystems	1
2.	Power Supply	+5 V, dc,+12 V dc	1
3.	DAC Interface board	-	1

PROBLEM STATEMENT:

The program is executed for various digital values and equivalent analog voltages aremeasured and also the waveforms are measured at the output ports using CRO.

THEORY:

Since DAC 0800 is an 8 bit DAC and the output voltage variation is between –5v and +5v. The output voltage varies in steps of 10/256 = 0.04 (approximately). The digital data input and the corresponding output voltages are presented in the table. The basic idea behind the generation of waveforms is the continuous generation of analog output of DAC. With 00 (Hex) as input to DAC2 the analog output is –5v. Similarly with FF H as input, the output is +5v. Outputting digital data 00 and FF at regular intervals, to DAC2, results in a square wave of amplitude 5v.Output digital data from 00 to FF in constant steps of 01 to DAC2. Repeat this sequence again and again. As a result a saw-tooth wave will be generated at DAC2 output. Outputdigital data from 00 to FF in constant steps of 01 to DAC2.Output digital data from FF to 00 in constant steps of 01 to DAC2. Repeat this sequence again and again. As a result a triangular wavewill be generated at DAC2 output.

ALGORITHM:

Measurement of analog voltage:

1. Send the digital value of DAC.
2. Read the corresponding analog value of its output.

Waveform generation:

Square Waveform:

1. Send low value (00) to the DAC.
2. Introduce suitable delay.
3. Send high value to DAC.
4. Introduce delay.
5. Repeat the above procedure.

Saw-tooth waveform:

1. Load low value (00) to accumulator.
2. Send this value to DAC.
3. Increment the accumulator.
4. Repeat step (2) and (3) until accumulator value reaches FF.
5. Repeat the above procedure from step 1.

4 STEPPER MOTOR INTERFACING WITH 8085

AIM:

To operate stepper motor by interfacing with 8085 microprocessor.

THEORY:

Stepper Motor

A stepper motor is a device that translates electrical pulses into mechanical movement in steps offixed step angle.

- The stepper motor rotates in steps in response to the applied signals.It is mainly used for position control.
- It is used in disk drives, dot matrix printers, plotters and robotics and process control circuits.

Structure

Stepper motors have a permanent magnet called rotor (also called the shaft) surrounded by a stator. The most common stepper motors have four stator windings that are paired with a center-tap. This type of stepper motor is commonly referred to as a four-phase or unipolar stepper motor. The centertap allows a change of current direction in each of two coils when a winding is grounded, thereby resulting in a polarity change of the stator.

Interfacing

Even a small stepper motor require a current of 400 mA for its operation. But the ports of the microcontroller cannot source this much amount of current. If such a motor is directly connected to the microprocessor/microcontroller ports, the motor may draw large current from the ports and damage it. So a suitable driver circuit is used with the microprocessor/microcontroller to operate themotor.

Motor Driver Circuit (ULN2003)

Stepper motor driver circuits are available readily in the form of ICs. ULN2003 is one such driverIC

Motor Driver Circuit (ULN2003)

Stepper motor driver circuits are available readily in the form of ICs. ULN2003 is one such driver IC which is a High-Voltage High-Current Darlington transistor

array and can give a current of 500mA.This current is sufficient to drive a small stepper motor. Internally, it has protection diodesused to protect the motor from damage due to back emf and large eddy currents. So, this ULN2003is used as a driver to interface the stepper motor to the microprocessor.

Operation

The important parameter of a stepper motor is the **step angle**. It is the minimum angle through which the motor rotates in response to each **excitation pulse**. In a four phase motor if there are 200 steps in one complete rotation then then the step angle is 360/200 = 1.8O . So to rotate the stepper motor we have to apply the excitation pulse. For this the controller should send a hexa decimal code

through one of its ports. **The hex code mainly depends on the construction of the stepper motor**.So, all the stepper motors do not have the same Hex code for their rotation. (refer the operation manual supplied by the manufacturer.)

For example, let us consider the hex code for a stepper motor to rotate in clockwise direction is 77H

, BBH , DDH and EEH. This hex code will be applied to the input terminals of the driver throughthe assembly language program. To rotate the stepper motor in anti-clockwise direction the same code is applied in the reverse order.

6(A) 8-BIT ADDITION

AIM:

To write a program to add two 8-bit numbers using 8051 microcontroller and also toverify the result.

APPARATUS REQUIRED:

8051 microcontroller kit ,key board.

ALGORITHM:

1. Clear Program Status Word.
2. Select Register bank by giving proper values to RS1 & RS0 of PSW.
3. Load accumulator A with any desired 8-bit data.
4. Load the register R 0 with the second 8- bit data.
5. Add these two 8-bit numbers.
6. Store the result.
7. Stop the program.

PROGRAM:

6(B) 8-BIT SUBTRACTION

AIM:

To perform subtraction of two 8 bit data using the 8051 microcontroller and store theresult in memory.

APPARATUS REQUIRED:

8051 microcontroller kit ,key board.

ALGORITHM:

1. Clear the carry flag.
2. Initialize the register for borrow.
3. Get the first operand into the accumulator.
4. Subtract the second operand from the accumulator.
5. If a borrow results increment the carry register.
6. Store the result in memory.

6(C) 8-BIT MULTIPLICATION

AIM:

To perform multiplication of two 8 bit data using 8051 microcontroller and to store theresult in memory.

APPARATUS REQUIRED:

8051 microcontroller kit ,key board.

ALGORITHM:

1. Get the multiplier in the accumulator.
2. Get the multiplicand in the B register.
3. Multiply A with B.
4. Store the product in memory.

8 INTERFACING DAC WITH 8051

AIM:

To interface DAC with 8051 to demonstrate the generation of square wave, triangular wave and sawtooth wave

APPARATUS REQUIRED:

8051 microcontroller kit, key board.

APPARATUS REQUIRED:

8051 Trainer Kit, DAC interface board

ALGORITHM:

SQUARE WAVE GENERATION:

1. Move the port address of DAC to DPTR
2. load the initial value 00 TO accumulator and move it to DAC
3. CALL THE DELAY PROGRAM
4. Load the final value FF to accumulator and move it to DAC
5. Call the delay program

9 STEPPER MOTOR INTERFACING WITH 8051

AIM:

To operate stepper motor by interfacing with 8051 microcontroller.

THEORY:

A motor in which the rotor is able to assume only discrete stationary angular position is a stepper motor. The rotary motion occurs in a step-wise manner from one equilibrium position to the next. Stepper Motors are used very wisely in position control systems like printers, disk drives, process control machine tools, etc.

The basic two-phase stepper motor consists of two pairs of stator poles. Each of the fourpoles has its own winding. The excitation of any one winding generates a North Pole. A South Pole gets induced at the diametrically opposite side. The rotor magnetic system has two end faces.It is a permanent magnet with one face as South Pole and the other as North Pole.

The Stepper Motor windings A1, A2, B1, B2 are cyclically excited with a DC current torun the motor in clockwise direction. By reversing the phase sequence as A1, B2, A2, B1, anticlockwise stepping can be obtained.

2-PHASE SWITCHING SCHEME:

In this scheme, any two adjacent stator windings are energized. The switching scheme isshown in the table given below. This scheme produces more torque.

ANTICLOCKWISE						CLOCKWISE					
STEP	**A1**	**A2**	**B1**	**B2**	**DATA**	**STEP**	**A1**	**A2**	**B1**	**B2**	**DATA**
1	1	0	0	1	9h	1	1	0	1	0	Ah
2	0	1	0	1	5h	2	0	1	1	0	6h
3	0	1	1	0	6h	3	0	1	0	1	5h
4	1	0	1	0	Ah	4	1	0	0	1	9h

ADDRESS DECODING LOGIC:

The 74138 chip is used for generating the address decoding logic to generate the device select pulses, CS1 & CS2 for selecting the IC 74175.The 74175 latches the data bus to the steppermotor driving circuitry.

Stepper Motor requires logic signals of relatively high power. Therefore, the interface circuitry that generates the driving pulses use silicon darlington pair transistors. The inputs for the interface circuit are TTL pulses generated under software control using the Microcontroller Kit. The TTL levels of pulse sequence from the data bus is translated to high voltage output pulses using a buffer 7407 with open collector.

```
  // GREEN light ON
        digitalWrite(red, LOW);
        digitalWrite(yellow, LOW);
         digitalWrite(green, HIGH);
         delay(5000);  // 5 seconds

   // YELLOW light ON
        digitalWrite(red, LOW);
         digitalWrite(yellow, HIGH);
        digitalWrite(green, LOW);
        delay(2000);  // 2 seconds
  }
```

Output

- ❖ Traffic lights operate in the standard order:
- ❖ RED → GREEN → YELLOW → RED

Result

Thus the design and implementation of a Traffic Light Controller using Arduino was completed.

11 PROGRAMMING RASPBERRY PI WITH SOFTWARE TOOLS.

Aim:

To write and execute a sample Raspberry Pi program to blink an LED using GPIO pins.

Components Required:

- Raspberry Pi (any model)
- Raspbian / Raspberry Pi OS
- LED
- 220Ω resistor
- Breadboard and jumper wires.

GPIO Connection:

Component	Raspberry Pi Pin
LED (+)	GPIO 18 (Pin 12)
LED (–)	GND (Pin 6)

Working Explanation

- GPIO mode is set to BCM
- GPIO 18 is configured as output
- LED turns ON for 1 second and OFF for 1 second
- Loop runs continuously until interrupted

Program for Traffic Light Control using Raspberry Pi

```
import RPi.GPIO as GPIO
import time
# Use Broadcom SOC channel numbering
GPIO.setmode (GPIO.BCM)
LED = 18
GPIO.setup (LED, GPIO.OUT)
try:
   while True:
      GPIO.output (LED, GPIO.HIGH)  # LED ON
      time.sleep(1)
      GPIO.output(LED, GPIO.LOW)   # LED OFF
      time.sleep(1)
except KeyboardInterrupt:
```

```
    print("Program stopped by user")
finally:
    GPIO.cleanup()
```

Output

LED connected to Raspberry Pi blinks continuously.

Result

Thus, the design and implementation of a Traffic Light Controller using Raspberry Pi was completed.

ADDITIONAL EXPERIMENTS

12 STUDY OF ARM EVALUATION SYSTEM

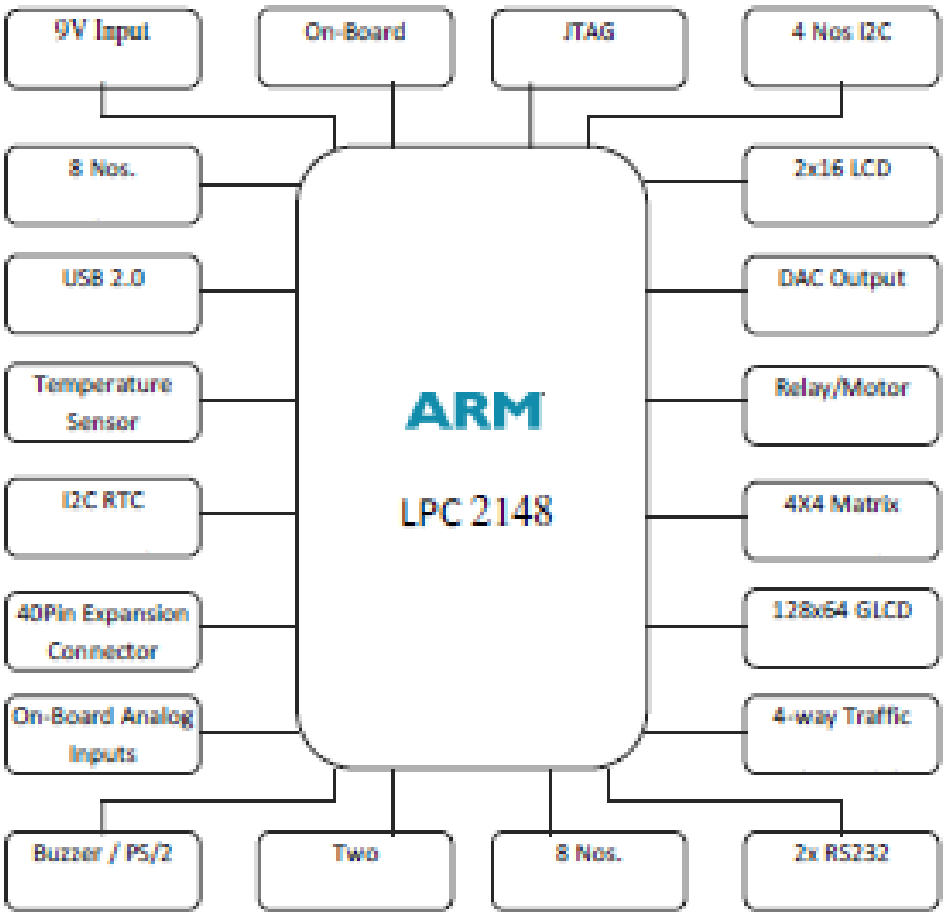
AIM:

To study of ARM processor system and describe the features of architecture.

ARCHITECTURE OF ARM PROCESSOR:

Features of ARM DEVELOPMENT KIT Processor:

- 16-bit/32-bit ARM7TDMI-S microcontroller in a tiny LQFP64 package.8 kB to 40 kB of on-chip static RAM and 32 kB to 512 kB of on-chip flash memory. 128-bit wide interface/accelerator enables high-speed 60 MHz operation. In-System/In-Application Programming (ISP/IAP) via on-chip boot loader software.
- Single flash sector/full chip erase in 400 ms and programming of 256 bytes in 1ms.USB 2.0 Full- speed compliant device controller with 2 kB of endpoint RAM. The LPC2146/48 provides 8 kB of on- chip RAM accessible to USB by DMA.
- One or two (LPC2141/42 vs. LPC2144/46/48) 10-bit ADCs provide a total of 6/14 analog inputs, with conversion times as low as 2.44 μs per channel. Single 10-bit DAC provides variable analog output (LPC2142/44/46/48 only).Two 32-bit timers/external event counters (with four capture and four compare channels each), PWM unit (six outputs) and watchdog.
- Low power Real-Time Clock (RTC) with independent power and 32 kHz clock input. Multiple serial interfaces including two UARTs (16C550), two Fast I2Cbus (400 kbit/s), SPI and SSP with buffering and variable data length capabilities.
- Vectored Interrupt Controller (VIC) with configurable priorities and vector addresses. Up to 45 of 5 V tolerant fast general purpose I/O pins in a tiny LQFP64 package. Up to 21 external interrupt pins available.
- 60MHz maximum CPU clock available from programmable on-chip PLL with settling time of 100μs.On-chip integrated oscillator operates with an external crystal from 1 MHz to 25 MHz. Power saving modes include Idle and Power down.
- Individual enable/disable of peripheral functions as well as peripheral clock scaling for additional power optimization. Processor wake-up from Power-down mode via external interrupt or BOD. Single power supply chip with POR and BOD circuits: CPU operating voltage range of 3.0 V to 3.6 V (3.3 V ± 10 %) with 5 V

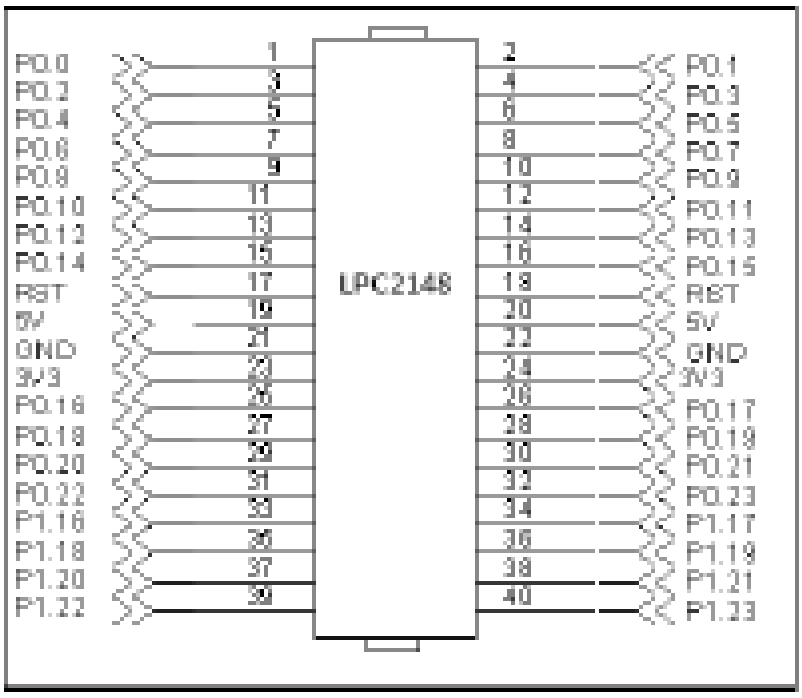


1.1. Power Supply:

- The external power can be AC or DC, with a voltage between (9V/12V, 1A output) at 230V AC input. The ARM board produces +5V using an LM7805 voltage regulator, which provides supply to the peripherals.
- LM1117 Fixed +3.3V positive regulator used for processor & processor related peripherals.

1.2. Flash Programming Utility NXP (Philips)

- NXP Semiconductors produce a range of Microcontrollers that feature both on-chip Flash memory and the ability to be reprogrammed using In-System Programming technology.



1.3. On-board Peripherals:

- 8-Nos. of Point LED's (Digital Outputs)
- 8-Nos. of Digital Inputs (slide switch)
- 2 Lines X 16 Character LCD Display
- I2C Enabled 4 Digit Seven-segment display
- 128x64 Graphical LCD Display
- 4 X 4 Matrix keypad
- Stepper Motor Interface
- 2 Nos. Relay Interface
- Two UART for serial port communication through PC
- Serial EEPROM
- On-chip Real Time Clock with battery backup
- PS/2 Keyboard interface (Optional)
- Temperature Sensor
- Buzzer (Alarm Interface)
- Traffic Light Module (Optional)

RESULT:

Thus, the study of ARM processor has been done and ensured its compositionwith internal features specifically.

13 PROGRAMS TO VERIFY TIMER AND INTERRUPTS OPERATIONS IN 8051 MICROCONTROLLER

AIM:

To write ALP to generate a square wave of frequency, transfer a data serially from one kit toanother and to verify the result.

APPARATUS REQUIRED:

8051 microcontroller kit, key board.

a) Program to generate a square wave of frequency.

Steps to determine the count:

Let the frequency of square wave to be generated be Fs KHz.And the time period of the square wave be Ts Sec.

Oscillator Frequency = 11.0592MHz. One machine cycle = 12 clock periods

Time taken to complete one machine cycle=12*(1/11.0592 MHz)

= 1.085microsec.Y(dec)

= (Ts/2)/(1.085microsec)

Count(dec) = 65536(dec) – Y(dec)

= Count (hexa)

PROGRAM:

```
MOV TMOD,#10h              ; To select timer1 & mode1 operation
L1:MOVTL1,#LOWERORDER BYTE OF THE COUNT
MOV TH1,#HIGHER ORDER BYTE OF THE COUNT
SETB TR1                   ; to start the timer (TCON.6)

```

b) Program to transfer a data serially from one kit to another.

Transmitter:

```
        MOV TMOD,#20H        ; Mode word to select timer1 &
        mode 2MOV TL1,#FDH ; Initialize timer1 with the count
        MOV TH1,#FFH
        MOV SCON,#50H        ; Control word for serial communication to
                             to select serial mode1
        SETB TR1             ; Start
        timer1MOV A,#06h
        MOV SBUF,A           ; Transfer the byte to be transmitted to serial

14 2 X 2 MATRIX MULTIPLICATION

AIM :

To perform the 2 x 2 matrix multiplication using 8085 microprocessor.

APPARATUS REQUIRED:

8085 microprocessor kit, key board.

ALGORITHM:

1. Load the 2 input matrices in the separate address and initialize the HL and the DE registerpair with the starting address respectively.
2. Call a subroutine for performing the multiplication of one element of a matrix with the otherelement of the other matrix.
3. Call a subroutine to store the resultant values in a separate matrix.
4. Halt
